

ALGEBRAIC PROPERTY OF ROUGH IMPLICATION BASED ON INTERVAL STRUCTURE

Xue Zhan-ao, He Hua-can and Ma Ying-cang

School of Computer Science, Northwestern Polytechnical University, Xi'an 710072, China

Abstract: Due to the shortage of rough implication in [4] ~ [6], rough set and rough implication operators are redefined by using interval structure in [7], the shortages have been improved. We have investigated the characteristics of the rough implication, and also point out that the good logic property of the rough implication in [7]. In this paper, we will study the algebraic properties of the rough implication in depth.

Key words: Rough Logic, Algebraic Property, Rough Implication, Approximation Spaces

1. INTRODUCTION

Rough set theory, introduced by Zdzislaw Pawlak in the early 1980s^[1-3], is a new mathematical tool to deal with many problems such as vagueness, uncertainty, incomplete data and reasoning. Now there are lots of papers about rough logic idea and its abroad application^[1-9], but some rough implication operators exist defects, for instance, $B^c \rightarrow A^c = A \rightarrow B$ doesn't hold in [4], $A \rightarrow A$ is not Theorem in [5,6], etc.. In order to eliminate those defects we redefine rough set system, and new rough operators such as intersection, union, complement and implication are expressed by using interval structure in [7]. The characteristics of this implication were investigated, and logic properties of rough implication were pointed out in [7]. Further, we will study the algebraic properties of the rough implication in this paper.

2. ROUGH SET THEORY

Definition 2.1 Let U be the universe set and R be an equivalent relation on U . A pair

(U, R) is called an approximate space. If $X \subseteq U$ is an arbitrary set, then two approximations are formally defined as follows:

$$\underline{X} = \{x \mid x \in U, [x]_R \subseteq X\}, \quad \overline{X} = \{x \mid x \in U, [x]_R \cap X \neq \emptyset\}.$$

Where $[x]_R$ is an equivalent class containing x . \underline{X} is called lower approximation of X , \overline{X} is called upper approximation of X . The approximate set X lies between its lower and upper approximations: $\underline{X} \subseteq X \subseteq \overline{X}$.

We get $-\overline{X} \subseteq -X \subseteq -\underline{X}$, where, $Z \subseteq U$ and $-Z$ is the complement of Z in U .

For each $X \subseteq U$, a rough set is a pair $\langle \underline{X}, \overline{X} \rangle$. We denote the empty set \emptyset by $\langle \emptyset, \emptyset \rangle = \langle \underline{\emptyset}, \overline{\emptyset} \rangle$, the universe set U by $\langle U, U \rangle = \langle \underline{U}, \overline{U} \rangle$ and the power set of U by $\mathfrak{R}(U)$.

Definition 2.2 Let $A, B \in \mathfrak{R}(U)$, the inclusion relation of two rough sets is defined by $A \subseteq B$ if and only if $\underline{A} \subseteq \underline{B}$ and $\overline{A} \subseteq \overline{B}$;

The equivalent relation of two rough sets is defined by

$$A = B \text{ if and only if } \underline{A} = \underline{B} \text{ and } \overline{A} = \overline{B}.$$

Definition 2.3 The intersection of two rough sets A and B is a rough set in approximate space, and is defined by $A \cap B = \langle \underline{A} \cap \underline{B}, \overline{A} \cap \overline{B} \rangle$,

The union of two rough sets is a rough set in approximate space, and is defined by $A \cup B = \langle \underline{A} \cup \underline{B}, \overline{A} \cup \overline{B} \rangle$,

The complement of A is a rough set in approximate space, and is defined by $A^c = \langle -\overline{A}, -\underline{A} \rangle$,

The pseudo complement of A is a rough set in approximate space, and is defined by $A^* = \langle -\underline{A}, -\overline{A} \rangle$,

Where $X \subseteq U$, $-X$ is the complement of X in U .

Theorem 2.4 Suppose $A, B \in \mathfrak{R}(U)$, then

$$\underline{A \cap B} = \underline{A} \cap \underline{B}, \quad \overline{A \cap B} \subseteq \overline{A} \cap \overline{B};$$

$$\underline{A \cup B} \supseteq \underline{A} \cup \underline{B}, \quad \overline{A \cup B} = \overline{A} \cup \overline{B}.$$

Proof. Theorem 2.4 follows from [1] ~ [3] and [8] ~ [9].

Theorem 2.5 If A^c is the complement of A in U , A^* is the pseudo complement of A in U , then

$$(1) A^c \subseteq A^*; \quad (2) A^{**} \subseteq A^{c*}; \quad (3) A^c \cup A^* = A^*, A^c \cap A^* = A^c;$$

$$(4) A^{c*c} = A^{c**} = \langle -A, -A \rangle; \quad (5) A^{cc*} = A^{*c*} = A^{***} = A^{**c} = A^{*cc} = A^*;$$

$$(6) A^{ccc} = A^c; \quad (7) A^{c*c*} = A^{c*}.$$

Proof. Theorem 2.5 can be proved easily from Definition 2.3.

Theorem 2.6 Let $A, B \in \mathfrak{R}(U)$, then,

$$(A \cap B)^c = A^c \cup B^c; \quad (A \cup B)^c = A^c \cap B^c;$$

$$(A \cap B)^* = A^* \cup B^*; \quad (A \cup B)^* = A^* \cap B^*.$$

Proof. Theorem 2.6 is easy to be proved by Definition 2.3.

3. ALGEBRAIC PROPERTIES OF ROUGH IMPLICATION

We redefine the implication operator in [7], which to improve the shortage of

rough implication in [4]~[6]. In this section, we will directly cite the definition implication operator \rightarrow , and will investigate its algebraic properties.

Definition 3.1 Let $mng(\varphi) = \langle \underline{A}, \overline{A} \rangle$, $mng(\psi) = \langle \underline{B}, \overline{B} \rangle$, $mng(\beta) = \langle \underline{C}, \overline{C} \rangle$, and mng is a bijection, for any $\varphi, \psi, \beta, 0, 1 \in P$, we have

$$\begin{aligned}
 & mng(\varphi \wedge \psi) = \langle \underline{A} \cap \underline{B}, \overline{A} \cap \overline{B} \rangle; & mng(\varphi \vee \psi) = \langle \underline{A} \cup \underline{B}, \overline{A} \cup \overline{B} \rangle; \\
 & mng(\varphi^c) = \langle \overline{-A}, \underline{-A} \rangle; & mng(\varphi^*) = \langle \underline{-A}, \overline{-A} \rangle; & mng(0) = \langle \phi, \phi \rangle; \\
 & mng(\varphi^{c*}) = \langle \underline{A}, \overline{A} \rangle; & mng(\varphi^{c*c}) = \langle \overline{-A}, \underline{-A} \rangle; & mng(1) = \langle U, U \rangle. \\
 & (\varphi \vee \psi)^c = \varphi^c \wedge \psi^c; & (\varphi \wedge \psi)^c = \varphi^c \vee \psi^c; & (\varphi \vee \psi)^* = \varphi^* \wedge \psi^*; \\
 & (\varphi \wedge \psi)^* = \varphi^* \vee \psi^*; & \varphi^{c*c} = \varphi^{c**}; & \varphi^{ccc} = \varphi^c; \\
 & \varphi^{c*c*} = \varphi^{c*}; & \varphi^{cc*} = \varphi^{*c*} = \varphi^{***} = \varphi^{**c} = \varphi^{*cc} = \varphi^*. \\
 & mng(\varphi \rightarrow \psi) = mng(\varphi^c \vee \psi \vee (\varphi^* \wedge \psi^{c*})) = \langle \underline{-A} \cup \underline{B} \cup (\overline{B} \cap \underline{-A}), \overline{-A} \cup \overline{B} \rangle
 \end{aligned}$$

(1)

Theorem 3.2 $(P, \vee, \wedge, ^c, 0, 1)$ is a boundary lattice.

Proof. Theorem 3.2 is easy to prove from definition 3.1 and [7].

Theorem 3.3 Let $A, B \in \mathfrak{R}(U)$, the following are equivalent:

- (1) $A \rightarrow B = \langle \underline{-A} \cup \underline{B} \cup (\overline{B} \cap \underline{-A}), \overline{-A} \cup \overline{B} \rangle$;
- (2) $A \rightarrow B = \langle (\underline{-A} \cup \underline{B}) \cap (\overline{-A} \cup \overline{B}), \overline{-A} \cup \overline{B} \rangle$.

Proof. Theorem 3.3 is easy to be proved from (1).

Proposition 3.4 Suppose $(P, \vee, \wedge, ^c, 0, 1)$ is called a boundary lattice which is inverse ordered involution, and \rightarrow is rough implication operator, the following are satisfied:

$$\begin{aligned}
 & \text{(IA.1)} \quad \varphi \rightarrow (\psi \rightarrow \beta) = \psi \rightarrow (\varphi \rightarrow \beta) & \text{(IA.2)} \quad \varphi \rightarrow \varphi = 1 \\
 & \text{(IA.3)} \quad \varphi \rightarrow \psi = \psi^c \rightarrow \varphi^c & \text{(IA.4)} \quad \text{if } \varphi \rightarrow \psi = \psi \rightarrow \varphi = 1, \text{ then}
 \end{aligned}$$

$\varphi = \psi$

$$\text{(IA.5)}$$

$$\varphi \vee \psi \rightarrow \beta = (\varphi \rightarrow \beta) \wedge (\psi \rightarrow \beta) \quad \text{(IA.6)} \quad \varphi \wedge \psi \rightarrow \beta = (\varphi \rightarrow \beta) \vee (\psi \rightarrow \beta)$$

Proof. The formulas can be proved by Theorem 3.3 and (I).

Proof of (IA.1)

$$\begin{aligned}
 & \varphi \rightarrow (\psi \rightarrow \beta) = \varphi^c \vee (\psi \rightarrow \beta) \vee (\varphi^* \wedge (\psi \rightarrow \beta)^{c*}) \\
 & = \varphi^c \vee (\psi^c \vee \beta \vee (\psi^* \wedge \beta^{c*})) \vee (\varphi^* \wedge (\psi^c \vee \beta \vee (\psi^* \wedge \beta^{c*}))^{c*}) \\
 & = \varphi^c \vee \psi^c \vee \beta \vee (\psi^* \wedge \beta^{c*}) \vee (\varphi^* \wedge (\psi^* \vee \beta^{c*} \vee (\psi^* \wedge \beta^{c*}))) \\
 & = \varphi^c \vee \psi^c \vee \beta \vee (\psi^* \wedge \beta^{c*}) \vee (\varphi^* \wedge \psi^*) \vee (\varphi^* \wedge \beta^{c*}) \vee (\varphi^* \wedge \psi^* \wedge \beta^{c*}) \\
 & \psi \rightarrow (\varphi \rightarrow \beta) = \psi^c \vee (\varphi \rightarrow \beta) \vee (\psi^* \wedge (\varphi \rightarrow \beta)^{c*}) \\
 & = \psi^c \vee (\varphi^c \vee \beta \vee (\varphi^* \wedge \beta^{c*})) \vee (\psi^* \wedge (\varphi^c \vee \beta \vee (\varphi^* \wedge \beta^{c*}))^{c*}) \\
 & = \psi^c \vee \varphi^c \vee \beta \vee (\varphi^* \wedge \beta^{c*}) \vee (\psi^* \wedge (\varphi^* \vee \beta^{c*} \vee (\varphi^* \wedge \beta^{c*})))
 \end{aligned}$$

$$= \psi^c \vee \varphi^c \vee \beta \vee (\varphi^* \wedge \beta^{c*}) \vee (\psi^* \wedge \varphi^*) \vee (\psi^* \wedge \beta^{c*}) \vee (\psi^* \wedge \varphi^* \wedge \beta^{c*})$$

$$= \varphi^c \vee \psi^c \vee \beta \vee (\psi^* \wedge \beta^{c*}) \vee (\varphi^* \wedge \psi^*) \vee (\varphi^* \wedge \beta^{c*}) \vee (\varphi^* \wedge \psi^* \wedge \beta^{c*})$$

Hence, $\varphi \rightarrow (\psi \rightarrow \beta) = \psi \rightarrow (\varphi \rightarrow \beta)$

Proof of (IA.2) Obviously, $\varphi \rightarrow \varphi = 1$

Proof of (IA.3)

$$\varphi^c \rightarrow \psi^c = \varphi^{cc} \vee \psi^c \vee (\varphi^{c*} \wedge \psi^{cc*}) = \psi^c \vee \varphi \vee (\psi^* \wedge \varphi^{c*})$$

$$\psi \rightarrow \varphi = \psi^c \vee \varphi \vee (\psi^* \wedge \varphi^{c*})$$

Hence, $\varphi \rightarrow \psi = \psi^c \rightarrow \varphi^c$.

Proof of (IA.4)

Because of $A \rightarrow B = \langle (-\underline{A} \cup \underline{B}) \cap (-\overline{A} \cup \overline{B}), -\underline{A} \cup \overline{B} \rangle$ $A \rightarrow B = U$ iff $A \rightarrow B = \langle (-\underline{A} \cup \underline{B}) \cap (-\overline{A} \cup \overline{B}), -\underline{A} \cup \overline{B} \rangle = \langle U, U \rangle$ iff $-\underline{A} \cup \underline{B} = U, -\overline{A} \cup \overline{B} = U, -\underline{A} \cup \overline{B} = U$ iff $\underline{A} \subseteq \underline{B}$ and $\overline{A} \subseteq \overline{B}$ iff $A \tilde{\subseteq} B$.

Analogously we have $B \rightarrow A = U$ iff $B \tilde{\subseteq} A$.

Hence, (IA.4) is proved.

Proof of (IA.5)

$$(\varphi \rightarrow \beta) \wedge (\psi \rightarrow \beta) = (\varphi^c \vee \beta \vee (\varphi^* \wedge \beta^{c*})) \wedge (\psi^c \vee \beta \vee (\psi^* \wedge \beta^{c*}))$$

$$= (\varphi^c \wedge \psi^c) \vee (\varphi^c \wedge \beta) \vee (\varphi^c \wedge \psi^* \wedge \beta^{c*}) \vee (\beta \wedge \psi^c) \vee \beta \vee (\beta \wedge \psi^* \wedge \beta^{c*})$$

$$\vee (\varphi^* \wedge \psi^c \wedge \beta^{c*}) \vee (\beta \wedge \varphi^* \wedge \beta^{c*}) \vee (\varphi^* \wedge \psi^* \wedge \beta^{c*})$$

$$= (\varphi^c \wedge \psi^c) \vee \beta \vee (\varphi^* \wedge \psi^* \wedge \beta^{c*})$$

$$(\varphi \vee \psi) \rightarrow \beta = (\varphi \vee \psi)^c \vee \beta \vee ((\varphi \vee \psi)^* \wedge \beta^{c*}) = (\varphi^c \wedge \psi^c) \vee \beta \vee (\varphi^* \wedge \psi^* \wedge \beta^{c*})$$

Hence, $\varphi \vee \psi \rightarrow \beta = (\varphi \rightarrow \beta) \wedge (\psi \rightarrow \beta)$.

Proof of (IA.6)

$$(\varphi \wedge \psi) \rightarrow \beta = (\varphi \wedge \psi)^c \vee \beta \vee ((\varphi \wedge \psi)^* \wedge \beta^{c*}) = (\varphi^c \vee \psi^c) \vee \beta \vee ((\varphi^* \vee \psi^*) \wedge \beta^{c*})$$

$$= (\varphi^c \vee \psi^c) \vee \beta \vee (\varphi^* \wedge \beta^{c*}) \vee (\psi^* \wedge \beta^{c*})$$

$$(\varphi \rightarrow \beta) \vee (\psi \rightarrow \beta) = (\varphi^c \vee \beta \vee (\varphi^* \wedge \beta^{c*})) \vee (\psi^c \vee \beta \vee (\psi^* \wedge \beta^{c*}))$$

$$= (\varphi^c \vee \psi^c) \vee \beta \vee (\varphi^* \wedge \beta^{c*}) \vee (\psi^* \wedge \beta^{c*})$$

Hence, $\varphi \wedge \psi \rightarrow \beta = (\varphi \rightarrow \beta) \vee (\psi \rightarrow \beta)$.

The poor is complete.

Proposition 3.5 Suppose $(P, \vee, \wedge, ^c, 0, 1)$ is called a boundary lattice which is inverse ordered involution, and \rightarrow is rough implication operator which is expressed by interval structure, then $(\varphi \rightarrow \psi) \rightarrow \psi \neq (\psi \rightarrow \varphi) \rightarrow \varphi$

Proof.

$$(\varphi \rightarrow \psi) \rightarrow \psi = (\varphi^c \vee \psi \vee (\varphi^* \wedge \psi^{c*}))^c \vee \psi \vee ((\varphi^c \vee \psi \vee (\varphi^* \wedge \psi^{c*}))^* \wedge \psi^{c*})$$

$$= (\varphi \wedge \psi^c \wedge (\varphi^{*c} \vee \psi^{c*c})) \vee \psi \vee ((\varphi^{c*} \wedge \psi^* \wedge (\varphi^{**} \vee \psi^{c**})) \wedge \psi^{c*})$$

$$= (\varphi \wedge \psi^c \wedge \varphi^{*c}) \vee (\varphi \wedge \psi^c \wedge \psi^{c*c}) \vee \psi \vee (\varphi^{*c} \wedge \psi^* \wedge \varphi^{**} \wedge \psi^{c**}) \vee (\varphi^{*c} \wedge \psi^* \wedge \psi^{c**} \wedge \psi^{c*})$$

$$= (\psi^c \wedge \varphi^{*c}) \vee (\varphi \wedge \psi^{c*c}) \vee \psi \vee (\psi^* \wedge \varphi^{**} \wedge \psi^{c*})$$

$$\text{Analogously, } (\psi \rightarrow \varphi) \rightarrow \varphi = (\varphi^c \wedge \psi^{*c}) \vee (\psi \wedge \varphi^{c*c}) \vee \varphi \vee (\varphi^* \wedge \psi^{**} \wedge \varphi^{c*})$$

Hence, $(\varphi \rightarrow \psi) \rightarrow \psi \neq (\psi \rightarrow \varphi) \rightarrow \varphi$ (except for $\varphi = \psi$).

Remark If $(P, \vee, \wedge, ^c, 0, 1)$ is lattice implicative algebra ^[11~13], then it is satisfied Proposition 3.4 (IA.1) ~ (IA.6) and $(x \rightarrow y) \rightarrow y = (y \rightarrow x) \rightarrow x$. Since the equivalence of lattice implicative algebra is normal FI-algebra ^[11],

¹⁴⁾, the operator \rightarrow is not satisfied $(x \rightarrow y) \rightarrow y = (y \rightarrow x) \rightarrow x$. Hence, $(P, \vee, \wedge, ^c, 0, 1)$ is not lattice implicative algebra, but it is *FI*-algebra^[11, 14].

4. CONCLUSION

The study of rough implication operators is the emphasis and difficulty in the field of rough logic. Due to definition the shortages of the rough implication operator in [4] ~ [6], we can not imply $B^c \rightarrow A^c = A \rightarrow B$ in [4], i.e. the inversely negative proposition and original proposition are not equivalent, and $A \rightarrow A$ isn't Theorem in [5, 6], etc... We redefine the rough intersection, rough union, rough complement and rough implication operator from the view of interval structure, which their relations and properties have been investigated in [7]. In this paper, we study the algebraic properties of the rough implication in a deep way, and also point out that $(P, \vee, \wedge, ^c, 0, 1)$ is not lattice implicative algebra, but it is *FI*-algebra, because the formula $(x \rightarrow y) \rightarrow y = (y \rightarrow x) \rightarrow x$ doesn't hold.
