Volume 1: divided into 4 sections: General anatomy, Trunk, Upper limb, Lower extremity.

Volume 2: Head, Eye, Ear, Neck, Brain and spinal cord.

Volume 3: Internal organs: Thorax, Abdomen, Pelvis and retroperitoneal space.

Booklet: 60 tables including 55 for the muscles and 5 for the cranial nerves. The muscles are forwarded each one with a diagram of localization, their origin, their termination and their function.

In the 3 volumes, each body or area is described in an exhaustive way, with photographs, boards, terms to be

retained and clinical indication. These two paragraphs make the work very attractive, by making a true encyclopedia.

The work is addressed, of course, to all the medical community—from the student to the experienced expert—but will also interest, with its section of encyclopedic note, all the readers interested in the complexity of the human body. A true must for orthopaedic surgeons.

Conflict of interest None.
