

Global Ethics and Nanotechnology: A Comparison of the Nanoethics Environments of the EU and China

Sally Dalton-Brown

Received: 28 February 2012 / Accepted: 17 June 2012 / Published online: 14 July 2012

Abstract The following article offers a brief overview of current nanotechnology policy, regulation and ethics in Europe and The People's Republic of China with the intent of noting (dis)similarities in approach, before focusing on the involvement of the public in science and technology policy (i.e. participatory Technology Assessment). The conclusions of this article are, that (a) in terms of nano-safety as expressed through policy and regulation, China PR and the EU have similar approaches towards, and concerns about, nanotoxicity—the official debate on benefits and risks is not markedly different in the two regions; (b) that there is a similar economic drive behind both regions' approach to nanodevelopment, the difference being the degree of public concern admitted; and (c) participation in decision-making is fundamentally different in the two regions. Thus in China PR, the focus is on the responsibility of the scientist; in the EU, it is about government accountability to the public. The formulation of a Code of Conduct for scientists in both regions (China PR's predicted for 2012) reveals both similarity and difference in approach to nanotechnology development. This

may change, since individual responsibility alone cannot guide S&T development, and as public participation is increasingly seen globally as integral to governmental decision-making.

Keywords Nanotechnology · China · EU · Regulation · Policy · Nanoethics · Global ethics · Participatory technology assessment

Ought bioethics in East Asia to use the same approaches (assumptions, principles, theories, styles, methods, concepts) as bioethics developed in the West, or ought it to reflect a specifically East Asian approach to the subject? ([18]: 310)

Ethics and socio-ethical analysis have increasingly become an integral part of the assessment of any new technology and its applications [7]. Certain European countries have instigated national programs dedicated to ethics in science and technology (S&T) (e.g. The Netherlands) or have established institutes to conduct research into the ethical implications of new technologies (e.g. national genomics centres in the UK and The Netherlands). In China PR, ethical, legal and social implications (ELSI) analysis is becoming a more prominent issue when evaluating new S&T

developments., but is not yet as well established as in Europe.

A growing trend since the 1980s in terms of S&T evaluation in the EU has been that of pTA, or participatory Technology Assessment, a drive towards incorporating social concerns into technology assessment through public dialogue. Such a trend has developed under pressure of increasing public scepticism about scientific research and development ([22]: 386). The outcome of such scepticism has been a demand for more informed public debate, and greater public involvement both in how new technologies should be regulated and funded ([14]: 211), and how they should be applied to everyday life. Policymakers anxious not to repeat the mistakes associated with the introduction of biotechnology initiatives such as genetically modified (GM) foods, namely, that ‘legislation came too late and with too little public engagement and ethical reflection’, began to call for the inclusion of ethical and societal impacts of potentially transformative new technologies at an early stage in policymaking [21, 26].

Public dissatisfaction in The People’s Republic of China (China PR) after various food safety scandals relating to milk and to gutter oil suggests scepticism about regulation is not only an EU issue.¹ A *China Daily* 2010 survey concluded that more than 85 % of respondents were worried about the potential health hazards of GM food.² Hu & Chen’s earlier survey of Beijing consumers found that consumers’ purchase intentions of GM vegetable oil were low, indicating a considerable scepticism toward GM products’ [24]. After the granting of biosafety licenses to two rice strains, 120 Chinese academics signed a public petition in March 2010 asking the Ministry of Agriculture to withdraw the certificates [27].

China PR has an established survey process on S&T public perceptions, but such a process has tended to be quite general, with a lack of surveys on specific issues and more importantly, a dearth

of implementation processes for using such surveys in policy debates.

Can China PR catch up to Europe in this area? Europe is increasingly co-operating and competing with both China and India, which are also keen to develop their S&T sectors. Such new interdependencies between global actors require, arguably, new global approaches to S&T policy, or at least, recognition of differing local approaches to what is perhaps a global science. The complex question of whether there can ever be a global approach that does not run the risk of neo-colonialism [3, 49], or an imposition of ‘colonial’ values on the East aside [19], one can note general similarities in Eastern and Western approaches to the dangers of nanotechnology. The major differences are in the processes by which public concerns are mediated in Europe and China PR.

China PR: Nanohistory, Nanoregulation, Nanopolicy and Nanoethics

Of the Asian countries, Japan and China are leading the way in nanotechnology. The national program in China PR dates from the establishment of the National Steering Committee for Nanoscience and Nanotechnology (NSCNN) in 2000 to coordinate nationwide efforts on nanotechnology R&D. The committee is composed of 21 scientists from universities, institutes and industry and 7 administrators from government agencies.

Research goes back 13 years before that, however, to the 1987 National High Technology Plan (or ‘863 Plan’), that supported ultrafine particles research. In 1990, the State Science and Technology Commission [the predecessor of the current Ministry of Science and Technology (MOST)] approved the ‘Climbing Up’ project, in which nanomaterials research was emphasized. In the early 1990s, several Chinese academic research organizations collaborated to accelerate research efforts in China on nanomaterials science, while MOST’s 973 Program (1999) was aimed at supporting basic research on nanostructures such as nanotubes. The 973 Program’s significance lies in its emphasis on the standardization of procedures and assessment and test protocols, which tend to form the basic framework structure for regulatory considerations of nanomaterials [25].

¹ The 2008 scandal, when milk from the Sanlu corporation was found to be contaminated by melamine, was China’s second major baby-milk scandal. The death toll from the Sanlu contamination varies, according to whom one reads, from 3 to 11, but up to 300 000 children were allegedly reported as affected. The gutter oil scandal erupted in September 2011 after reports of companies recycling oil from drains behind restaurants.

² *China Daily* 3 April, 2010. Retrieved January 7, 2012, from http://www.chinadaily.com.cn/china/2010-03/04/content_9534076.htm

Since 2002, when the China PR National Science Foundation produced a nanotechnology plan, nanotechnology has been recognized as a high-priority area by the Chinese government (Lee et al. 2011). In China PR's National Medium- and Long-term Science and Technology Development Plan (2006–2020), nanotechnology is one of four large projects explicitly mentioned in the plan as a priority mission area, and as a key frontier technology, over the next 15 years [45]. The 2009 national research plan set aside 0.15 billion RMB (yuan) for nanotechnology; Appelbaum and Parker conclude that, with respect to nanotechnology, China is closing the gap that once existed between itself and the United States, Europe, and Japan [4].

Presently, there are more than 30 research organizations in China PR that have initiated research activities studying the toxicological and environmental effects of nanomaterials and nanoparticles [52], and 120 research organisations undertaking general research into nanoscience and nanotechnology ([13]: 101). The three major national centres for nanotech are the National Centre for Nanoscience and Nanotechnology (NCNST) in Beijing, the Nanocommercialisation centre in Tianjin, and the China Safety Lab, which comes under the auspices of the Chinese Academy of Sciences (CAS).³ The three areas of research, commercialisation, and safety to which these three centres are dedicated aptly indicate PR China's current foci.

In the view of Tang, Carley and Porter, the initial focus for China PR was regulatory support for significant research for technology commercialization and economic growth. However, a 2004 conference on biological and environmental nanoeffects and the launch of a program on the toxicological effects of nano suggested the start of a China PR nanosafety debate. As Qi argued, nanosafety research became 'an integral part of nanotechnology research' [39]. China has run two major 5-year projects: 'The Toxicological Effects of Carbon Nanomaterials' (2004–2008), and 'The Environmental Activity and Health Impact of Ambient Superfine Particle' (2006–2010). The China Nanosafety Lab, which examines environmental health and toxicology matters, is linked into a

larger network of research centres for nanosafety. From its inception in 2008 with the establishment of the Laboratory for Biomedical Effects of Nanomaterials and Nanosafety, it has worked with the Research Centre for Cancer Nanotechnology (at the Tianjin Cancer Hospital), the Lab for the Bio-environmental Effects of Nanomaterials and Nanosafety (established by the Institute of High-Energy Physics, or IHEP, and the NCNST), and the nano-biological research group at IHEP.

The debate has intensified after a nanoparticle exposure accident in a poorly ventilated Chinese paint factory in August 2007, in which seven workers contracted lung disease—two died [43]. After this incident, 'Chinese policymakers shifted focus to the risk management aspects of nanotechnology' [46]; a large-scale program began in 2011 for example on factory monitoring for worker exposure. The 2007 incident realised several questions about whether the causal link between exposure and pulmonary illness can in fact be proven.

While the effects of nanoparticles on humans and on the environment have been the priority, there has also been acknowledgement of other societal concerns. The Director's Note in the 2007–8 Annual Report of the China Nanosafety Lab for example states that the lab 'must take an extensive and deep research of nanotechnological influence on human health, environment, and social problems' [20].

In terms of oversight, the Ministry of Science and Technology is generally responsible for S&T policies and the planning and execution of national S&T plans and programs. It is also responsible for drafting rules, regulations and laws, and has responsibility for policy implementation. MOST plays an important role in distributing research funds including projects implemented by other agencies. MOST is supported by the Chinese Academy of Science and Technology for Development (CASTED), an institution that undertakes foresight and strategic research to provide macro-level advice and assistance for designing S&T plans. CASTED contains ISTS, the Institute of Science, Technology and Society, which conducts several large-scale surveys on matters such as food safety risk, the public image of scientists etc. One of its three main areas of interest is the social environment of innovation. Thus while initially emphasis was solely on applied research in the nanotechnology field, new research teams such as the Institute of Policy and

Management (IPM), part of the Chinese Academy of Sciences, have now been formed.⁴

Nanoethics (China PR)

China PR is beginning to face a range of nanotechnology governance challenges, such as addressing low public awareness, developing a robust risk research strategy, and implementing an effective oversight system, very similar to those confronting the EU. One general concern that has emerged is whether the public outside of China, especially the United States public, will trust Chinese-made nanoproducts in the wake of scandals involving tainted pet food, toothpaste, children's toys, and drugs. Michelson asks:

...can China find an effective way to move up the value chain and transition from manufacturing cheaper, low-end products to more expensive, high-end, nano-engineered goods? In the wake of more immediate environmental and public health concerns currently affecting China, from managing pollution, to depleted fisheries, to lack of access to healthcare, how will disruptive challenges posed by nanotechnology exacerbate or enhance these existing problems? Will China have the resources and the luxury of proactively addressing environmental and health risks posed by nanotechnology in addition to these ongoing challenges? ([32]:406).

The concern with nanoethics started later in China PR than in the EU, not only due to the development delay in technology, but also perhaps because of differences in emphasis on societal concern. In other words, China PR's belief in social progress through scientific development means that economic impetus, rather than societal concern, is the major driver and overriding impetus behind new technologies.

Choi has argued in 2003 that the following issues should be considered by Asian nanoethicists:

- Equity between those with access to technology and those without, both in terms of developed versus underdeveloped countries, as well as internally within rural and urban populations

- Privacy issues in Confucian systems (there has long been debate over the individual's right to privacy of medical information, for example)
- Gender issues (as the majority of nanoscientists are male)
- Brain implants and other issues relating to human enhancement
- Undue inducement, for human subjects in nanomedical clinical trials for example
- Military uses of new technologies
- Environmental toxicity, including how effectively nanowaste can be managed in space-limited countries with large populations.

These issues, when compared to EU debates on nanoethics, are quite similar (see Table 1 in the Appendix). Choi's recommendations are:

- Better ethics education in schools
- More dialogue between research institutes, granting bodies, and the public on ethical issues
- Bioethics education for medical practitioners
- More ELSI research funding
- More international cooperation and knowledge sharing
- Establishing NGOs to work primarily on ethical concerns related to technology development
- Establishing independent watchdogs for nanotechnology-related policy and research for government and business [10].

In China PR, CASTED has called for S&T ethics courses in universities on the basis that education is the main channel for building a culture of S&T values. Tsinghua University for example has an engineering ethics course. Several Chinese universities (Dalian Technology University, Beijing University, as well as Renmin, Hunan, and South-East), have research centres based around S&T ethics. CASTED is involved in the GEST (Global Ethics in Science and Technology) project as part of the EU 7th framework. GEST aims to explore the role of ethics in science and technology policy as it is currently developing both in Europe and in the two main global emerging economies of China and India.⁵

What of the Chinese debate? Compared to the reasonably extensive debate in the EU, it is fairly low-key (see Table 2). Chinese commentators have,

⁴ Professor Zhenzhen Li, Bilat-Silk (Bilateral Support for the International Linkage with China, FP7, 222800) roundtable on 9 November, 2011 at CASTED, Beijing, China PR.

Table 1 Categories of nanoethics issues in the East and West (China PR/EU)

Issue	Pro (West)	Contra (West)	Contra (East)
Enhancement	A new and improved ‘better human’ with increased longevity, fewer health issues, possibly even enhanced intelligence through IT/cognitive/biological convergence (NBIC)	Creation of new elites (enhancement only for the rich); loss of ‘humanness’ (‘nanoself’); increased longevity means more pressure on resources	IT/neurobioengineered implants; equity of access
Military use	Better wound care; more precise targeting (less collateral damage)	Leading to ‘unequal wars’; creation of ‘supersoldiers’	Military uses of nanotechnology, i.e. weapons
Health risks	Health amelioration, better drugs; portability—better health care for remote and rural communities; economic benefit of reduced health care spending	Threats to human health through dermal exposure or inhalation or ingestion of nanoparticles	Threats to human health through dermal exposure or inhalation or ingestion of nanoparticles
Environmental harm	Amelioration of environmental issues such as non-potable groundwater	Threat to environmental health	Threat to environmental health; nanowaste and space limitations
Access/Equity	General economic benefit globally in terms of new products that will affect the construction, energy, medtech and IT industries	Increased (nano)divide between developed and developing countries—issues of distributive justice, global benefit	Nanodivides within Asian countries with large rural and/or poor populations; undue inducement
Privacy	Smaller and less obtrusive surveillance devices; privacy of medical information; greater security	Increasingly miniaturised surveillance devices lead to potential loss of civil liberties, increased surveillance of average citizens	

albeit in very brief fashion, noted toxicity risks such as damage to human health and the environment. However, some have introduced other issues. Ying likens nanotechnology to GM foods issues, implying a public acceptance issue, albeit only in passing [51]. Li, while mentioning environmental problems (giving the example of a Korean company that stopped production of a certain washing machine after pressure from Friends of the Earth) notes wider issues such as increased lifespan due to nanomedical development, i.e. the societal impact of longer-living, healthy citizens [30]. Wang notes potential problems relating to consumer rights (in the context of food and cosmetics products), as well as privacy and intellectual property rights issues. [48]. Fan, perhaps the most ‘Western’ in his writing on nanoethics, notes that ‘compared with safety issues, research on ethical, legal and social issues should be strengthened’, as should dialogue between the scientific community and the public [17]. As Cao and Li note, the shift in approach from a predominately science-community-based approach to nanotechnology policy and regulation, to one that includes social scientists as well, is still ongoing [9].

Public Participation in the East

The Thai government is reviewing the country’s first strategy plan on nanotechnology safety and ethics, drafted in 2011. The Thai National Nanotechnology Center, NANOTEC, held a public hearing session in Bangkok in 2012 where stakeholders from various sectors were given an opportunity to voice their opinion on the draft. (Nanosafety labeling can be expected in 2016, when regulations on nano safety and ethics are fully enforced.)⁶ In South Korea NGOs play an active role in bringing together scientists and the public. The ‘STS’ or Science-Technology-Society approach informs the Korean school curriculum, just as in Japan schoolchildren are given guidelines to bioethics [11]. In Taiwan, the National Strategic Plan for Responsible Nanotechnology, reflects the government’s ambition to realize the full potential of nanotechnologies while acknowledging the possibly harmful societal impacts from nanotechnologies.

⁶ Thailand pushing forward on Nanosafety regulations’, January 18, 2011. Retrieved 12 December, 2011, from <http://www.biospectrumasia.com/content/180111THA15262.asp>.

Table 2 A comparison of nanoethics environments in the EU and China

	Europe	Asia (China)
Social values:	Autonomy, individual human rights	Harmony, community
Attitude towards S&T and scientists:	<ul style="list-style-type: none"> • Public differentiation between technologies i.e. differing risks for nuclear, nano, GM • Risk v benefit • Post-Fukushima emphasis on confidence/or lack thereof in government, according to how it handles S&T crises 	<ul style="list-style-type: none"> • Innovation is always good • <i>Tao</i> governs technology; • Harmony between <i>tian</i> (nature) and <i>ren</i> (human) • Trust in government (although this may be starting to decrease due to food scandals) • Concern with social responsibility of scientists
GM food as example	GM ‘backlash’ in many EU countries	GM issue products sold in China—but must be labelled; public distrust
Which nanoissues are seen as significant?	Toxicity (human and environmental), enhancement, military use, privacy, distributive justice	Safety; science governance; global security an emerging issue, as is public knowledge deficit
Economic benefit focus	Better drugs e.g. for cancer treatment	General economic driver
Consumer confidence in new products	EU 2013 mandatory labelling of cosmetics that contain nanoparticles	New equals good; and ‘nano’ are pluses for marketeers
Institutes leading nanoresearch	EC <i>Action Plan on Nanotechnology 2005–9</i> (ongoing implementation reports in 2007, 2009)	2000: National Steering Committee for Nanoscience and Nanotechnology established in China; 2003; nanosafety lab
Seminal reports that have triggered nanoethics concerns:	Greenpeace report, the Royal Society and Royal Academy (RS/RAE), report and insurance company Swiss Re’s report (2003–4)	
Role of NGOs in S&T advising:	Strong in terms of TA and policymaker liaison	NGOs small in size and relatively weak in organisational capacity, no policy-effecting channels
TA infrastructure	Varied across Europe	Established for about 10 years
Participatory technology assessment	Many European dialogue initiatives, plus individual (national) initiatives in Germany, the Netherlands, UK etc.	<ul style="list-style-type: none"> • Not yet—planned for 2012 • Consensus conference 2008 on GM food—with 25 participants; from that negative experience scientific community focussed on Code of Conduct as way of promoting acceptance
Global view and cooperation	On standards	On standards Increasing awareness of Western debates
International bodies—IRG, GHS, ISO, REACH, Comest, OECD etc.	EU representatives on all	China PR active on ISO and REACH
Codes?	EU Code for responsible nanoresearch	<ul style="list-style-type: none"> • MOST S&T general guidelines applied to nanoresearch from beginning • CAS Special committee on science ethics examined scientific misconduct in 2010–11 and has ethics of emerging technologies as next focus (GM and nano) • Code predicted in 2012

Much of this information was taken from roundtable discussions in Beijing 9–11 November, 2011

(The combination of nanotechnology and Chinese herbal medicine is a newly emerging field sought after by the Taiwanese industry, and is leading to some

ethical discussion, most notably around intellectual property issues [23]). In the most recent Taiwanese Science and Technology Development Plan [34],

nanotechnology is given specifically notable attention. Two passages in the plan stand out and provide particular insight in to the government's outlook on technology policy:

The public's distrust of science and technology is at least partially attributable to insufficient relevant information and awareness. Appropriate ethical and legal responses may be needed to deal with the risks posed by new technologies to life and the environment, and the ethical conflicts they cause...Unlike such areas as medical biotechnology, where ethics committees have been established, little has been done thus far to address research ethics in many new technological fields in Taiwan (such as genetic technology and nanotechnology).⁷

The issue of 'public distrust' is one that China PR has been starting to face in terms of GM food. Whilst expert Technology Assessment (TA) has a history in China PR, it tends to be dominated by natural scientists with little background in social issues. Information delivery, rather than debate, is more likely to be the aim of any survey, as in the Dalian Technical University 2008 nanotechnology survey (of 1,000 samples). This survey concluded that the Chinese public had greater awareness of nano than the US. CASTED conducted a survey in three cities in 2008 on GM food, concluding that public non-awareness of the subject was widespread (while noting variations according to city size and level of tertiary education).

While TA is known, participatory Technology Assessment (pTA) is a relatively new development, and has so far been limited in China PR to a consensus conference on GM food in 2008, one with 25 participants. This conference was organised by CAS, and the S&T commission for Xicheng District, Beijing. Called 'Science and Community 2008—GM foods', the aim was to recruit volunteers from varied socio-economic backgrounds; 38 applications were received, from which 20 public participants were chosen (plus 5 experts on GM foods and health, ethics and society, consumer choice and legislation). The final

document report showed more uncertainty post-conference than before about the relationship between the public and experts, as some participants began to 'modify their submissive position towards the experts' while remaining supportive towards the government. The primary result of the conference, it was concluded, was clarification of the need for more public education.⁸

GM food, nanotechnology, stem cell technology and IT, are still seen as the major areas of attention for the science community, rather than the public, but there is a growing realisation amongst the scientific community that a wider approach, involving greater awareness of societal concerns, and potentially also pTA, is required. A November 2011 workshop on academic morality and scientific ethics to facilitate integration between the natural and the social sciences suggest the China PR scientific community's realisation that the social sciences have an integral role to play in technology evaluation and implementation.

EU Nanohistory, Nanoregulation, Nanopolicy and Nanoethics

China PR is not alone in its belief that nanotechnology is an economic driver: In terms of the 2004 Lisbon Strategy, now replaced by the Europe 2020 strategy, Europe has clarified stated its aim of being a highly competitive knowledge-based global economy.⁹ A focus on nanotechnologies was seen as a key part of this strategy. Thus the formation of the 2004 European Nano-Electronics Initiative Advisory, in terms of which European technology companies such as Philips, Nokia, Ericsson, AMD, and IBM decided that if Europe wanted to lead the world, it would need to invest at least 6 billion euro per year to switch from micro to nanoscale electronics. A public-private partnership charged to develop and implement a European nano-electronics research agenda first met in 2004. Its goals include: supporting research and investment in nano, speeding up innovation and productivity, the facilitation and acceleration of market penetration of new technologies, aligning research/technology with European policies and regulatory frameworks, and

increasing public awareness, understanding, and acceptance of nanotechnologies ([1]: 238–9). A later group, The European Network of Excellence (Nano2Life) 2004–2008 involved nearly 200 scientists, 23 research organizations, and 12 countries, and has joined with industrial partners to identify regional centers, disciplines, and expertise available for collaboration. Goals included developing joint research projects on four major technical platforms: functionalisation, handling, detection, and integration of nanodevices.

The history of EU nanoregulation should be placed in the context of biotechnology regulation, which dates back to the establishment in 1991 of a European Commission Group on Ethics in Science and Technology. The Group was constituted to advise the Commission on how to exercise its powers as regards the ethical aspects of biotechnology. It noted in its general report examples of embedded ethics into policy such as the Science and Society Action Plan (2001), the Action Plan Life Sciences and Technology (2007), as well as legislative activities such as directives governing clinical trials, patents, data protection, the use of animals in experimentation, and the EU Chemical, Biological, Radiological or Nuclear (CBRN) Action Plan (2009).¹⁰ The EGAIS (Ethical Governance of Emerging Technologies) project, funded by the 7th Framework Programme (Science in Society) for example, has as its mission ‘to overcome the existent limitations of the current approaches to ethical governance in projects with technical development’.¹¹ The European Commission’s Directorate-General and Services involved in nanotechnology number over a dozen, including 7 agencies for risk evaluation.¹²

EU awareness of nanotechnology issues began in earnest in 2003, after discussion on potential risks by the European Parliament’s Green Party, [36] and after the publication of the 2001 National Nanotechnology Initiative (NNI) in the USA. In terms of the EU’s ‘framework’ structures for funding research and

technological development, Framework Programme 6 (FP6) (2002–6) indicated that nanotechnology had become a research priority, possibly stimulated by a need to compete with the USA. FP6 was introduced with policy objectives to enhance innovation, and to ‘change the European research landscape through the introduction of the integrated European Research Area (ERA), and create sustainable growth, increased employment and greater social cohesion’ [37].

The 3 EC Scientific Committees set up in 2004 were: SCCS (the Scientific Committee on Consumer Safety), which oversees nanomaterials in consumer products; SCER (the Scientific Committee on Health and Environmental Risks), which looks at nanotechnology in food, as well as medical and environmental issues, and SCENHIR (the European Commission’s Scientific Committee on Emerging and Newly Identified Health Risks), which looks at methodologies for risk assessment of new technologies such as nanotechnology.¹³

The EC’s Action Plan on Nanotechnology (2005), as well as considering possible adverse effects on health and the environment, also highlighted the ethical issues of nanotechnology’s potential to contribute towards the Millennium Development Goals. As well as discussing public participation and education, the Plan encouraged internationally cooperative work on nanoregulation. In 2007, the European Commission accepted the first implementation report (2005–2007) of the Action Plan. The second implementation report was adopted in 2009, with the statement that ‘efforts to address societal and safety concerns must be continued to ensure the safe and sustainable development of nanotechnology’.¹⁴

The European Group on Ethics in Science and New Technologies (EGE) set up in 1991, has a strictly advisory role, with a global outlook rather than a specifically EU one (Heemeren). The EGE’s 2006 Opinion 21 paper underlined ‘the vital importance of addressing concern for safety with respect to ... nanotechnology in general’. It advocated, in regards to nanomedicine, the need to ‘establish measures to verify the safety of nanomedical products’, and issues of military usage of nanotechnology, enhancement,

economic equity and animal testing.¹⁵ The EGE group has been referred to as ‘largely unknown’, however, according to a public (admittedly global rather than EU) survey.¹⁶ Another EU advisory group is ETAG, The European Technology Assessment Group, which runs projects on the potential environmental, health and safety risks of engineered nanomaterials (such as their project on chemical risk in 2006, and on human enhancement in 2008–9).

The High Level Expert Group (HLEG) was convened by the EC in 2010 to develop possible policy measures to promote the industrial take-up of new technologies by EU industries. The HLEG’s nanotechnology report suggests two views of convergence, one implying mutually enabling technologies, and the other a culture of promotion of enhancement (Foresighting: 2; de S. Cameron, [12]: 29). The interesting parts of the HLEG document are its advocacy of both moral pluralism, and of the need for ethics to be an intrinsic part of technological advances. Stating that technological development must ‘harmonize with the values of diversity, social justice, international security, and environmental responsibility’, it recommends preparation of an international ‘code of good conduct’.¹⁷

The European Project *NanoCode*, a 2-year multi-stakeholder dialogue providing input to the European Code of Conduct for Responsible Nanosciences & Nanotechnologies Research commenced in January 2010, with the aims of monitoring stakeholder input and suggesting revisions to this Code of Conduct (EU-Coc).¹⁸ In 2011, its report on stakeholder attitudes towards the Code concluded that awareness of the code ‘was limited to a community of selected key experts’ and was not ‘embedded in the everyday life’ of the large majority of researchers in Europe. The report also concluded that few governments seemed able to communicate the Code’s principles to

stakeholders effectively.¹⁹ An issue raised by stakeholders has been that of the ‘lack of teeth’ of voluntary codes such as this, which have not been widely adopted—although some research institutions claim that their own codes are sufficient. This raises the further issue of whether the Code should be promoted as the ‘one and only’, or allowed to coexist with the institutional guidelines. Suggestions on how to give the Code some ‘teeth’ ranged from the development of tailor-made codes i.e. specific for nano-companies, a ‘naming and blaming’ in case of non-compliance, linking compliance to public funding, and incorporation of the Code into the EC Research Framework as a guideline.

In 2008, the European Commission (Regulatory Aspects of Nanomaterials) concluded that existing EU regulatory frameworks covered in principle the potential health, safety and environmental risks related to nanomaterials, and stressed that the protection of health, safety and the environment needed to be enhanced mainly by improving the implementation of current legislation. In answer to this communication, however, the European Parliament declared the EC’s statement to be misleading and ‘one-dimensional’.²⁰

Nanoethics (EU and the West)

Whereas nanoethics in China PR is an emerging field, and still remains focused to a degree on toxicity risk, Western commentators have a wider view of potential NELSI issues. A 2008 summary of ‘nanorisks’— or ‘nanopportunities’, depending on one’s level of optimism—include ownership of technology and accountability; privacy (increasingly undetectable nanoscale devices); human enhancement, and public involvement in technology development ([50]:17). Bennett-Woods notes issues of human dignity and also of fidelity, or competing loyalties—security versus privacy or profit versus equity—as well as social justice, military and security implications, and informed consent to new technological ideas ([6]:5). Spagnolo and

²⁰ European Parliament: Report on regulatory aspects of nanomaterials (2008/2208(INI)). Committee on the Environment, Public Health and Food Safety. A6-0255/2009. Retrieved 3 February, 2012 from <http://nano.foe.org.au/node/329>.

Daloiso, arguing that nanomedicine is the most useful application of nanotechnology, summarise ethical issues as: toxicity, immunogenicity and biocompatibility, nanoparticle stability, human enhancement, privacy and integrity, and the shift from patient-doctor interaction to home-care technology used by the patient ([44]: 396). Schummer selects six areas of concern, including the more speculative areas of the increasing autonomy of machines, how nano should be controlled (the ‘grey goo’ scenario), and of biomedical application or enhancement. He also sees military applications, health and environmental risks, and the equity issue of developing countries, as well as the issue of intellectual property rights [41]. New nano-products may lead to a displacement of jobs and major changes in trade balances between countries; manufacturing in countries with weaker controls and subsequently exported worldwide may increase risk, and benefits may be unevenly distributed (leading to a so-called ‘nanodivide’—[33]). More broadly, nanotechnology has been condemned for its potential to advance Western consumerism; little research has been aimed at products that might benefit the poor [31].

The West shares with China PR a strong concern however on toxicity risk. The effect of nanotoxins on humans, animals and the environment have yet to be determined, and laboratory studies have suggested some physical damage through the inhalation of nanoparticles, leading to the fear that nanotech might potentially be ‘the next asbestos’ ([2]:5). Nanoparticles have been alleged to damage DNA, negatively affect proteins, and cause cell death [28]. A study at the University of Rochester found that when rats breathed in nanoparticles, the particles settled in the brain and lungs, which led to significant increases in biomarkers for inflammation and stress response [8]. Mice studies have also found that nanoscale titanium dioxide, touted for use in many energy applications, can cause genetic instability [47]. A 2-year study at UCLA’s School of Public Health found laboratory mice consuming nano-titanium dioxide showed DNA and chromosome damage [15]. Several types of engineered nanomaterials including titanium dioxide and carbon nanotubes are believed to produce pulmonary inflammation and fibrosis in animals [42], and even brain damage [35]. Nanoparticles may increase the risk of strokes [16]. There is concern that carbon nanotubes may potentially be ‘the next asbestos’ [2]. A further

issue is that of environmental damage, as there is no clear view on how long nanoengineered materials may last in landfill, for example. (The table in Appendix A attempts to categorise these commonly agreed issues, and the arguments pro and contra their benefit, indicating the level of similarity between East and West.)

Public Participation in the EU

The UK government has stated that ‘properly targeted and sufficiently resourced public dialogue will be crucial in securing a future for nanotechnologies’ ([40]: para. 80). There have been several EU projects designed to increase public dialogue on the socio-ethical concerns of nanotechnology, such as Nanologue (2005–6), aimed at the facilitation of a Europe-wide dialogue among science, business and civil society about its benefits and potential impacts, or Nanobio-RAISE (2006–7) intended to bring together nanobiotechnologists, ethicists and communication specialists to anticipate and discuss societal and ethical issues, or Nanoplatt (2009), aimed at the ‘points of intersection between the sphere of production on the one hand and consumers on the other.’²¹ The SNAP global public consultation conducted from 18 December 2009 to 19 February 2010, concluded optimistically that, there was a ‘good or very good perception of EU governance related to nanotechnologies in terms of stakeholder consultation and setting research priorities’ (SNAP: 4, 17). However, another EU project, framingNano (2008–2010), noted greater uncertainty about public acceptance of nanotechnology.

Individual EU members also have run dialogue initiatives; for example, in The Netherlands, ‘NanoNed’ allocates 15 % of its budget to research on societal impact,²² while ‘Nanopodium’ (launched in December 2009 in The Netherlands) has as its mission the stimulation of public dialogue about the threats, opportunities and applications of nanotechnology. In Germany’s ‘NanoDialogue’, representatives from the scientific world, the business community, environmental, consumer and women’s associations, trade

unions, churches, ministries and authorities provide input in to the public debate on the opportunities and risks of using nanotechnologies.

However, despite the positive initiatives—and many more—listed above, the 2009 reflection on the seminal 2004 Royal Society report argued that more needs to be done in the field of public engagement. The report added that nanoparticles allegedly are being released into the environment and that in the view of one collaborator on the updated report, there has been no ‘meaningful change in regulatory practice or social engagement in the UK’ ([5]: 5, 46).

Global Collaboration

...it is still necessary to set up a viable system based on the precautionary principle.....since research in the field of social and ethical evaluation of nanotechnology developments in China is not as advanced as in the USA and Europe, cooperation is important to avoid making similar mistakes and to promote the smooth development of nanotechnology ([13]: 106).

The major achievement of the EU nanoadvisory ‘movement’ has been the establishment of standards for working with nanomaterials. The CEN/TC 352 ‘Nanotechnologies’ (established in 2005) to develop a set of standards, and the 2006 EC establishment of REACH—Registration, Evaluation, Authorisation and Restriction of Chemical Substances addressing the following aspects of nanotechnologies: classification, terminology and nomenclature; metrology and instrumentation, including specifications for reference materials; test methodologies; modelling and simulation; science-based health, safety and environmental practices; and nanotechnology products and processes.²³

The second major achievement is the 2009 Code of Conduct for Responsible Nanosciences and Nanotechnologies Research, described as follows:

The recently released Code...developed by the European Commission is one code that is voluntary, but which has originated in a political sphere and which demands a higher level of accountability.... the code seeks to intervene at an earlier stage in the

development cycle of nanotechnologies, embedding principles of responsibility at the research stage.²⁴

Given its recent focus on nanosafety, unsurprisingly China PR has published 15 nanotechnology standards since the establishment of its Committee of National Nanotechnology Standards (2005), which dealt mainly with risk assessment of nanoparticles. This focus translated into its international work on the global nanotechnology regulation bodies/projects, of which there are 9 major ones, including REACH, already mentioned above. The other 8 are: (1) the International Council on Nanotechnology (ICON) [29]; (2) the European Standards Committee (CEN/TC352) Nanotechnologies (set up with the aim of providing an international standard)²⁵; (3) the Globally Harmonised Scheme for classification and labeling of substances (GHS); and (4) the International Standards Organization (ISO). The various ISO standards provide ways of evaluating risk; they are primarily methodological tools for industry players. However it should be noted that the ISO has a member list of 162 countries, including China, which has been involved in 707 standards—more than any other of the countries listed.²⁶ (China PR hosted ISO/TCC 229 in 2008 in Shanghai).

The 5th is the International Council on Risk Governance (IRGC), established in 2003, at the initiative of the Swiss government; its Council has members from 13 different countries, one of which is China.²⁷ The final 3 are: The Commission on the Ethics of Scientific Knowledge and Technology (UNESCO/COMEST) and two OECD nanotechnology working parties, WPN (the Working Party on Nanotechnology), with a focus on governance, and WPMN (the Working Party on Manufactured Nanomaterials), an international forum for the further development of test

guidelines and strategies needed for the proper implementation of regulation.

The OECD and UNITAR jointly held Awareness-Raising Workshops on Nanotechnology/Manufactured Nanomaterials for Developing and Transition Countries, held in Beijing, Abidjan, Lodz, Kingston, and Alexandria. In addition to the formal structures discussed briefly above, there have been international dialogues such as that on the Responsible Research and Development of Nanotechnology (established by The European Commission in 2004), and the Meridian Institute's Global Dialogue on Nanotechnology and the poor, which has resulted in a paper, a news service, and two workshops (India and Brazil, 2006 and 2007).²⁸

A November 2011 project on research methods for managing the risk of engineered nanoparticles and engineered nanomaterials, the MARINA project, under FP 7 of the EC, will run for 4 years and involve the collaboration of 47 different scientific and industrial partners, including China PR.

There are also individual joint country agreements, such as the 2002 EU/China co-operation agreement in the field of material sciences. This agreement facilitates the participation of Chinese research organisations, including companies, in European research projects with Chinese funding and vice versa. In addition, the EU and China have a joint agreement to exchange data relating to safety testing in order to boost research into consumer safety respective to nanotechnology products.

China's regulatory regime for the management of nanotechnology chemicals will likely manage risks comparable to those identified under the EU's REACH regulation, and in this context, in 2009, the government revised the chemical substance rules in order to incorporate risk assessment, risk management and data submission requirements, similar to REACH ([25]:11–12).

Conclusion: The Nano Environment in China PR Versus in the EU

Although there are obvious economic drivers behind the development of nanotechnology in both countries,

²⁸ http://www.merid.org/Content/Projects/Global_Dialogue_on_Nanotechnology_and_the_Poor.aspx

the difference is in the degree of account taken of public concern, and the greater emphasis on development over social concerns in China PR. In the latter, industry employs the label of 'nano' as a plus point when advertising nanoproducts, whereas in Europe there is concern about nanolabelling, as well as more vocal consumer movements. However, the current food debate in China may signify a turning point in the perception of scientific development, and a need to accelerate public debate. The focus in China is currently on the responsibility of the scientist; in the EU it is on government accountability to the public—yet one might risk the prediction here that ultimately this will also become a governmental issue in China, since individual responsibility alone cannot guide S&T development.

Whereas the official debate on benefits and risks is not markedly different in both areas, the public debate in China PR lags behind the EU. This is partly due to the fact that the public in China PR appears currently more concerned about GM food, and also to a lack of channels for public participation in China PR.

Yet public participation is globally seen as increasingly integral to governmental decision making, particularly given the economic effects of product boycotting, and China PR will arguably soon (and perhaps already is in terms of GM food) face this inevitable issue. The two regions are converging.

Acknowledgements The author gratefully acknowledges assistance from UCLan in terms of a travel grant for the 3-day Beijing trip during which much of the information presented in this article was garnered. Thanks go to Dr Milton Ladikas (UCLan) for arranging the Beijing discussions, and for commenting on the draft of this article. Professor Doris Schroeder (UCLan) also assisted with revision and editing. I am also very grateful to Associate Professor Ma Ying, CASTED, for supplying me with several recent articles on nanoethics, and to my translators Yvonne Yu, Sissi Wang, and Rocky Liang, for assisting in their decoding.
