Complexifiable characteristic classes

Alexander D. Rahm

This article is dedicated to Mark F. Feshbach (1950–2010), for his valuable work on cohomology rings of classifying spaces

Abstract We examine the topological characteristic cohomology classes of complexified vector bundles. In particular, all the classes coming from the real vector bundles underlying the complexification are determined.

Keywords Characteristic classes · Classifying spaces of groups and H-spaces · Stable classes of vector space bundles

Mathematics Subject Classification   55R40

1 Introduction and statement of the results

In the theory of characteristic classes (in the sense of Milnor and Stasheff [4], whom we follow in terminology and notation in this article), it is well-known how the Chern classes are mapped to even Stiefel–Whitney classes when converting complex vector space bundles to real vector space bundles by forgetting the complex structure. In the other direction, we have the fibre-wise complexification: Given a real vector bundle $F \to B$ with fibre $\mathbb{R}^n$, its complexification is the complex vector bundle $F^{\mathbb{C}} := F \otimes_{\mathbb{R}} \mathbb{C} \to B$ obtained by declaring complex multiplication on $F \oplus F$ in each fibre $\mathbb{R}^n \oplus \mathbb{R}^n$ by $i(x, y) := (-y, x)$ for the imaginary unit i. The Pontrjagin classes of a real vector bundle are (up to a sign) constructed as Chern classes of its complexification. Conversely, which classes of a real vector bundle can be attributed

A. D. Rahm (✉)

e-mail: Alexander.Rahm@nuigalway.ie
URL: http://www.maths.nuigalway.ie/~rahm/

to its complexification? These are the *complexifiable* characteristic classes which we determine in this article, under the request that they are characteristic classes in the sense of [4].

Consider a real vector bundle $F \to B$ and a complex vector bundle $E \to B$ over the same paracompact Hausdorff base space B (we keep the latter assumption on B throughout this article).

Definition 1 A real vector bundle F is called a *real generator bundle* of E, if its complexification $F^{\mathbb{C}}$ is isomorphic to E. In the case that such a bundle F exists, we call E *real-generated*.

Not every complex vector bundle is real-generated; as the odd degree Chern classes have the property $c_{2k+1}(\overline{E}) = -c_{2k+1}(E)$ on the complex conjugate bundle $\overline{E}$, it is an easy exercise to show that no complex vector bundle with some nonzero and non-2-torsion odd Chern class can admit a real generator bundle. This makes it seem possible that the subcategory of real-generated vector bundles could admit information additional to its Chern classes, in terms of complexifiable classes of the real generator bundles. However, we will see that the Chern classes already contain all of the relevant information.

Definition 2 A characteristic class c of real vector bundles is *complexifiable* if for all pairs (F, G) of real vector bundles with isomorphic complexification $F^{\mathbb{C}} \cong G^{\mathbb{C}}$, the identity $c(F) = c(G)$ holds.

We will now give a complete classification of the complexifiable characteristic classes. Denote by $\mathbb{Z}_2 := \mathbb{Z}/2\mathbb{Z}$ the group with two elements.

Theorem 1 *Let c be a polynomial in the Stiefel–Whitney classes w_i, $i \in \mathbb{N} \cup \{0\}$. Then the following two conditions are equivalent:*

(i) *The class c is an element of the sub-ring $\mathbb{Z}_2[w_i^2]_{i \in \mathbb{N} \cup \{0\}}$ of the polynomials in the Stiefel–Whitney classes.*
(ii) *The class c is complexifiable.*

The implication (i)⇒(ii) follows easily from the fact that the square of the n-th Stiefel–Whitney class of a real vector bundle is the mod-2-reduction of the n-th Chern class of the complexified vector bundle. The proof of the implication (ii)⇒(i) is prepared with several intermediary steps leading to it. One ingredient, Lemma 1, follows essentially from work of Cartan on fibrations of H-spaces (at Cartan's time called Hopf spaces). But this only allows us to show that complexifiable characteristic classes in cohomology with $\mathbb{Z}_2$-coefficients are contained in the *ideal* generated by the squares of the Stiefel–Whitney classes. To show that they constitute exactly the *subring* generated by the squares of the Stiefel–Whitney classes, which is much smaller, we need the technical decomposition of Lemma 2 that we prove by induction.

By their naturality, characteristic classes are uniquely determined on the universal bundle over the classifying space ($B\mathcal{O}$ for real vector bundles). As the cohomology ring $H^*(B\mathcal{O}, \mathbb{Z}_2)$ is generated by the Stiefel–Whitney classes of the universal bundle, all modulo 2 characteristic classes are polynomials in the Stiefel–Whitney classes, and Theorem 1 tells us which of them are complexifiable.

We build on this result to investigate which integral cohomology classes are complexifiable. To express our result, we use Feshbach's description [3] of the cohomology ring of the classifying space $B\mathcal{O}$ with $\mathbb{Z}$-coefficients. Generators for this ring are known since Thomas [5,6], and all the relations between its generators are known since Brown [1] and Feshbach [3]. Consider the Steenrod squaring operation Sq^1 and the mod-2-reduction homomorphism

$$\rho : \mathrm{H}^*(B\mathcal{O}, \mathbb{Z}) \to \mathrm{H}^*(B\mathcal{O}, \mathbb{Z}_2).$$

As generators for $\mathrm{H}^*(B\mathcal{O}, \mathbb{Z})$, Feshbach uses Pontrjagin classes and classes V_I with index sets I that are finite nonempty subsets of $\left\{\frac{1}{2}\right\} \cup \mathbb{N}$, admitting mod-2-reductions

$$\rho(V_I) = Sq^1 \left(\bigcup_{i \in I} \omega_{2i} \right),$$

where ω_i is the i-th Stiefel–Whitney class of the universal bundle over $B\mathcal{O}$. In particular, we have a generator $V_{\left\{\frac{1}{2}\right\}}$. We give the details of Feshbach's description in the appendix. Our final result now takes the following shape.

Theorem 2 *Let C be a polynomial in V_I^2, with I arbitrary, $V_{\left\{\frac{1}{2}\right\}}$ and the Pontrjagin classes. Then C is complexifiable.*

And conversely, we can say the following.

Theorem 3 *Let C be a complexifiable integral characteristic class. Then for any real vector bundle ξ, $C(\xi)$ is completely determined by some Chern classes $c_k(\xi^{\mathbb{C}})$, $k \in \mathbb{N}$.*

2 Classes in cohomology with $\mathbb{Z}_2$-coefficients

In this section, we shall prove Theorem 1, after developing all the tools we need to do so. For this entire section, we only consider cohomology with $\mathbb{Z}_2$-coefficients. We write $\mathbb{N}$ for the natural numbers without 0.

Let $F \to B$ be a real vector bundle over a paracompact Hausdorff base space. Let c be a complexifiable polynomial in the Stiefel–Whitney classes w_i. Let $\mathcal{O}$ be the direct limit of the orthogonal groups, U the direct limit of the unitary groups and EU the universal total space to the classifying space BU for stable complex vector bundles. Let $B\mathcal{O} := EU/\mathcal{O}$, via the inclusion $\mathcal{O} \subset U$ induced by the canonical inclusion $\mathbb{R} \subset \mathbb{C}$. Let $\gamma(\mathbb{R}^\infty)$ be the universal bundle over $B\mathcal{O}$, and denote its Stiefel–Whitney classes by $\omega_i := w_i(\gamma(\mathbb{R}^\infty))$. Let ε be the trivial vector bundle.

Lemma 1 *Let c be a complexifiable class in cohomology with $\mathbb{Z}_2$-coefficients. Then $c(\gamma(\mathbb{R}^\infty)) - c(\varepsilon)$ is contained in the ideal $\langle \omega_i^2 \rangle_{i \in \mathbb{N}}$.*

Proof We use Cartan's fibration of H-spaces [2] p. 17–22 (fibration en espaces de Hopf),

$$U/\mathcal{O} \xrightarrow{\;\;f\;\;} B\mathcal{O} \xrightarrow{\;\;p\;\;} BU.$$

The cohomology ring $H^*(BO, \mathbb{Z}_2)$ is the polynomial algebra $\mathbb{Z}_2[\omega_1, \omega_2, \dots]$ with generators the Stiefel–Whitney classes of the universal bundle. Cartan [2] p. 17–22 has shown that f^* maps these generators ω_i to the generators $v_i := w_i(f^*\gamma(\mathbb{R}^\infty))$ of the exterior algebra

$$H^*(U/\mathcal{O}, \mathbb{Z}_2) = \bigwedge(\mathbb{Z}_2[v_1, v_2, \dots]),$$

which is obtained by dividing out the ideal $\langle v_i^2 \rangle_{i \in \mathbb{N}}$ of the polynomial algebra $\mathbb{Z}_2[v_1, v_2, \dots]$. Hence, exactly the ideal $\langle \omega_i^2 \rangle_{i \in \mathbb{N}}$ is mapped to zero. So,

$$\langle \omega_i^2 \rangle_{i \in \mathbb{N}} = \ker f^*.$$

Composing f with the projection $p : BO \to BU$, we obtain a constant map and therefore a trivial bundle $(p \circ f)^*\gamma(\mathbb{C}^\infty)$. This pullback of the complex universal bundle is the complexification of $f^*\gamma(\mathbb{R}^\infty)$:

$$(p \circ f)^*\gamma(\mathbb{C}^\infty) = f^*p^*EU \times_U \mathbb{C}^\infty = f^*E\mathcal{O} \times_\mathcal{O} \mathbb{C}^\infty = f^*(E\mathcal{O} \times_\mathcal{O} \mathbb{R}^\infty)^\mathbb{C}$$
$$= f^*\gamma(\mathbb{R}^\infty)^\mathbb{C} = (f^*\gamma(\mathbb{R}^\infty))^\mathbb{C}.$$

So, $f^*\gamma(\mathbb{R}^\infty)$ admits a trivial complexification, and all of the complexifiable classes c must treat it like the trivial bundle ε:
$c(f^*\gamma(\mathbb{R}^\infty)) = c(\varepsilon)$. A pullback of the trivial bundle is trivial too, so

$$0 = c(f^*\gamma(\mathbb{R}^\infty)) - c(f^*\varepsilon) = f^*(c(\gamma(\mathbb{R}^\infty)) - c(\varepsilon))$$

by naturality. Whence, $c(\gamma(\mathbb{R}^\infty)) - c(\varepsilon)$ is an element of the kernel of f^*, which we have identified with the ideal $\langle \omega_i^2 \rangle_{i \in \mathbb{N}}$. $\square$

The above lemma allows us to write the characteristic class c under investigation as a sum over products with squares of Stiefel–Whitney classes,

$$c(\gamma(\mathbb{R}^\infty)) - c(\varepsilon) = \sum_{j=1}^{m} \omega_{i_j}^2 \cup r_j(\gamma(\mathbb{R}^\infty)),$$

with r_j some polynomials in the Stiefel–Whitney classes. We must inductively identify squares of Stiefel–Whitney classes as factors of the remainders r_j, until we achieve the decomposition claimed in the following lemma.

Notation For indices $j_1, \dots, j_s \in \mathbb{N}$ and $i_{j_1}, \dots, i_{(j_1,\dots,j_s)} \in \mathbb{N}$, we shall write $\vec{j}_s := (j_1, \dots, j_s)$ and $I(\vec{j}_s) := \{i_{\vec{j}_1}, \dots, i_{\vec{j}_s}\}$. We set $\vec{j}_0 := 0$.

Note that the classes $c(\varepsilon)$, $r_{\vec{j}}(\varepsilon)$ of the trivial bundle ε that we are going to use now, are just coefficients in $H^0(BO, \mathbb{Z}_2) \cong \{0, 1\}$.

Lemma 2 *Any complexifiable characteristic class c admits a decomposition*

$$c(\gamma(\mathbb{R}^\infty)) \; - \; c(\varepsilon) \;\; = \;\; \left(\sum_{j_k=1}^{m_{\vec{j}_{k-1}}} \omega_{i_{\vec{j}_k}}^2 \, r_{\vec{j}_k}(\gamma(\mathbb{R}^\infty))\right) \; \cup \; \left(\bigcup_{n=1}^{k-1} \sum_{j_n=1}^{m_{\vec{j}_{n-1}}} \omega_{i_{\vec{j}_n}}^2\right)$$

$+ \sum_{s=1}^{k-1} \bigcup_{n=1}^{s} \sum_{j_n=1}^{m_{\vec{j}_{n-1}}} \omega_{i_{\vec{j}_n}}^2 \, r_{\vec{j}_n}(\varepsilon)$ *for some* $k, m_{\vec{j}_0}, \ldots, m_{\vec{j}_{k-1}} \in \mathbb{N} \cup \{0\}$, *some* $i_{\vec{j}_1}, \ldots, i_{\vec{j}_k} \in \mathbb{N}$, *some* $r_{\vec{j}_k}(\gamma(\mathbb{R}^\infty)) \in H^*(B\mathcal{O}, \mathbb{Z}_2)$, *and some coefficients* $r_{\vec{j}_1}(\varepsilon), \ldots, r_{\vec{j}_{k-1}}(\varepsilon) \in \{0, 1\}$, *such that the following inequality holds:* $2 \sum_{p \in I(\vec{j}_k)} p > \deg c$.

Remark A Once that this lemma is established, we use that the degree must be the same on both sides in order to deduce that the sum over all terms containing a factor $\bigcup_{p \in I(\vec{j}_k)} \omega_p^2$ exceeding the degree of c via the requested inequality must already be zero. So in fact, the decomposition is of the form

$$c(\gamma(\mathbb{R}^\infty)) - c(\varepsilon) = \sum_{s=1}^{k-1} \bigcup_{n=1}^{s} \sum_{j_n=1}^{m_{\vec{j}_{n-1}}} \omega_{i_{\vec{j}_n}}^2 \cup r_{\vec{j}_n}(\varepsilon),$$

meaning that $c(\gamma(\mathbb{R}^\infty))$ is a polynomial in some squares ω_p^2, $p \in \mathbb{N} \cup \{0\}$, which implies Theorem 1, (ii)$\Rightarrow$(i).

Before giving the proof of Lemma 2, we shall introduce two notations just to make that proof more readable.

Definition 3 An index vector $\vec{j}$ *appears* in a given decomposition of $c(\gamma(\mathbb{R}^\infty)) - c(\varepsilon)$ if both $\left(2 \sum_{p \in I(\vec{j})} p\right) \leq \deg c$ and this decomposition admits a summand of the form $r_{\vec{j}}(\gamma(\mathbb{R}^\infty)) \cup \bigcup_{p \in I(\vec{j})} \omega_p^2$.

Note that the terms $\left(r_{\vec{j}}(\gamma(\mathbb{R}^\infty)) \cup \bigcup_{p \in I(\vec{j})} \omega_p^2\right)$ with $\left(2 \sum_{p \in I(\vec{j})} p > \deg c\right)$ must vanish in any decomposition of $c(\gamma(\mathbb{R}^\infty)) - c(\varepsilon)$. That is why we do not let them contribute in the last definition.

Definition 4 Set $\ell := \min_{\vec{j} \text{ appears}} \max I(\vec{j})$. Consider an index vector $\vec{j}$ appearing in a given decomposition of $c(\gamma(\mathbb{R}^\infty)) - c(\varepsilon)$.
If $\max I(\vec{j}) = \ell$, then we call $r_{\vec{j}}(\gamma(\mathbb{R}^\infty)) - r_{\vec{j}}(\varepsilon)$ a *lower degree remainder*.

As seen in Lemma 1, $c(\gamma(\mathbb{R}^\infty)) - c(\varepsilon)$ lies in $\ker f^* = \langle \omega_i^2 \rangle_{i \in \mathbb{N}}$, so there is a decomposition

$$c(\gamma(\mathbb{R}^\infty)) - c(\varepsilon) = \sum_{j_1=1}^{m} \omega_{i_{\vec{j}_1}}^2 \cup r_{\vec{j}_1}(\gamma(\mathbb{R}^\infty)),$$

for some $m \in \mathbb{N} \cup \{0\}$, some $i_{\vec{j}_1} \in \mathbb{N}$, and some $r_{\vec{j}_1}(\gamma(\mathbb{R}^\infty)) \in H^*(B\mathcal{O}, \mathbb{Z}_2)$. We will show that there is a lower degree remainder $r_{\vec{j}_1}(\gamma(\mathbb{R}^\infty)) - r_{\vec{j}_1}(\varepsilon)$ in this decomposition that lies in $\ker f^*$. Then, that lower degree remainder admits a decomposition as

a linear combination of squares $\omega_{i_{j_2}}^2$ with coefficients $r_{\vec{j}_2}(\gamma(\mathbb{R}^\infty))$ in $\mathrm{H}^*(B\mathcal{O}, \mathbb{Z}_2)$, leading to a new decomposition of $c(\gamma(\mathbb{R}^\infty)) - c(\varepsilon)$. So, inductively, we will replace a lower degree remainder in any given decomposition of $c(\gamma(\mathbb{R}^\infty)) - c(\varepsilon)$ by a linear combination the coefficients of which are remainders with longer index vectors. That is why after a finite number of these steps, the index vectors $\vec{j}$ will no longer appear, because the sums $\left(2\sum_{p\in I(\vec{j})} p\right)$ will exceed the degree of c. This is the moment when all lower degree remainders are eliminated and the decomposition described in Lemma 2 is achieved.

To carry out this strategy, we first need to introduce the following truncation procedure.

2.1 Truncated stable invariance

With Lemma 3, we shall give a sense to "the truncation of the equation $c(F \oplus G) = c(G)$ at the dimension ℓ". Define the bundles

$$F := pr_1^* f^* \gamma(\mathbb{R}^\infty) \longrightarrow U/\mathcal{O} \times B\mathcal{O}$$

and

$$G := pr_2^* \gamma(\mathbb{R}^\infty) \longrightarrow U/\mathcal{O} \times B\mathcal{O},$$

where pr_i is the projection on the i-th factor of the base space $U/\mathcal{O} \times B\mathcal{O}$. Let $\ell \in \mathbb{N}$. Consider the map

$$(id, emb_\ell) : (U/\mathcal{O} \times B\mathcal{O}_\ell) \hookrightarrow (U/\mathcal{O} \times B\mathcal{O})$$

where $emb_\ell : B\mathcal{O}_\ell \hookrightarrow B\mathcal{O}$ is the natural embedding into the direct limit. Then the bundle $G_\ell := (id, emb_\ell)^* G$ admits Stiefel–Whitney classes that are in bijective correspondence with those of the ℓ-dimensional universal bundle $\gamma_\ell(\mathbb{R}^\infty) \to B\mathcal{O}_\ell$.

To be precise, $G_\ell \cong pr_{B\mathcal{O}_\ell}^* \gamma_\ell(\mathbb{R}^\infty)$ and the situation is

$$
\begin{array}{cccc}
\gamma_\ell(\mathbb{R}^\infty) & G_\ell \cong pr_{B\mathcal{O}_\ell}^* \gamma_\ell(\mathbb{R}^\infty) & G := pr_2^* \gamma(\mathbb{R}^\infty) & \gamma(\mathbb{R}^\infty) \\
\downarrow & \downarrow & \downarrow & \downarrow \\
B\mathcal{O}_\ell \xleftarrow{\ pr_{B\mathcal{O}_\ell}\ } (U/\mathcal{O} \times B\mathcal{O}_\ell) & \xhookrightarrow{\ (id, emb_l)\ } (U/\mathcal{O} \times B\mathcal{O}) & \xrightarrow{\ pr_2\ } B\mathcal{O}.
\end{array}
$$

Especially, $w_p(G_\ell)$ vanishes for $p > \ell$. Compare the latter statements with [4].

Lemma 3 *Under the above assumptions, the following equation holds:*

$$\sum_{\substack{\max I(\vec{j}) \leq \ell \\ \vec{j} \text{ appears}}} r_{\vec{j}}(F \oplus G_\ell) \bigcup_{p \in I(\vec{j})} w_p^2(G_\ell) = \sum_{\substack{\max I(\vec{j}) \leq \ell \\ \vec{j} \text{ appears}}} r_{\vec{j}}(G_\ell) \bigcup_{p \in I(\vec{j})} w_p^2(G_\ell).$$

We will call it the equation $c(F \oplus G) = c(G)$ truncated at dimension ℓ.

Proof The bundle F inherits from $f^*\gamma(\mathbb{R}^\infty)$ the property of admitting a trivial complexification. As c is complexifiable, we have $c(F \oplus G) = c(G)$. Applying the induced cohomology map $(id, emb_\ell)^*$ to this equation, we obtain

$$c(id^* F \oplus emb_\ell^* G) = c(emb_\ell^* G)$$

and hence

$$c(F \oplus G_\ell) = c(G_\ell).$$

By the universality of $\gamma(\mathbb{R}^\infty)$, and the naturality of all characteristic classes with respect to the classifying maps of G_ℓ and $F \oplus G_\ell$, any given decomposition

$$c(\gamma(\mathbb{R}^\infty)) - c(\varepsilon) = \sum_{\vec{j}} r_{\vec{j}}(\gamma(\mathbb{R}^\infty)) \bigcup_{p \in I(\vec{j})} \omega_p^2$$

gives analogous decompositions

$$c(G_\ell) - c(\varepsilon) = \sum_{\vec{j}} r_{\vec{j}}(G_\ell) \bigcup_{p \in I(\vec{j})} w_p^2(G_\ell)$$

and

$$c(F \oplus G_\ell) - c(\varepsilon) = \sum_{\vec{j}} r_{\vec{j}}(F \oplus G_\ell) \bigcup_{p \in I(\vec{j})} w_p^2(F \oplus G_\ell).$$

By Theorem 1, (i)$\Rightarrow$(ii) the square w_p^2 is complexifiable and hence invariant under adding the bundle F of trivial complexification:

$$w_p^2(F \oplus G_\ell) = w_p^2(G_\ell).$$

Thus, the equation $c(F \oplus G_\ell) = c(G_\ell)$ can be rewritten using that all summands containing a factor $w_p(G_\ell)$ with $p > \ell$ vanish:

$$\sum_{\vec{j}}^{\max I(\vec{j}) \leq \ell} r_{\vec{j}}(F \oplus G_\ell) \bigcup_{p \in I(\vec{j})} w_p^2(G_\ell) = \sum_{\vec{j}}^{\max I(\vec{j}) \leq \ell} r_{\vec{j}}(G_\ell \bigcup_{p \in I(\vec{j})} w_p^2(G_\ell).$$

In order not to exceed the degree of c, also all terms with $2\sum_{p \in I(\vec{j})} p > \deg c$ must vanish:

$$\sum_{\substack{\vec{j} \\ \vec{j} \text{ appears}}}^{\max I(\vec{j}) \leq \ell} r_{\vec{j}}(F \oplus G_\ell) \bigcup_{p \in I(\vec{j})} w_p^2(G_\ell) = \sum_{\substack{\vec{j} \\ \vec{j} \text{ appears}}}^{\max I(\vec{j}) \leq \ell} r_{\vec{j}}(G_\ell) \bigcup_{p \in I(\vec{j})} w_p^2(G_\ell).$$

So, this last equation is the equation $c(F \oplus G) = c(G)$ truncated at the dimension ℓ.

$\square$

Proof of Lemma 2 We carry out the proof by *induction over the index vector identifying a lower degree remainder.*

Base case. Lemma 1 implies $c(\gamma(\mathbb{R}^\infty)) - c(\varepsilon) = \sum_{j_1=1}^{m} \omega_{i_{\vec{j}_1}}^2 \cup r_{\vec{j}_1}(\gamma(\mathbb{R}^\infty))$,

with $r_{\vec{j}_1}$ some polynomials in the Stiefel–Whitney classes.

Rename $i_1, \ldots, i_m$ such that $i_1 < i_2 < \cdots < i_m$.

We truncate the equation $c(F \oplus G) = c(G)$ at the dimension i_1, and obtain

$$\sum_{\substack{i_{j_1} \leq i_1 \\ \vec{j}_1 \text{ appears}}} r_{\vec{j}_1}(F \oplus G_{i_1}) \cup w_{i_{\vec{j}_1}}^2(G_{i_1}) = \sum_{\substack{i_{j_1} \leq i_1 \\ \vec{j}_1 \text{ appears}}} r_{\vec{j}_1}(G_{i_1}) \cup w_{i_{\vec{j}_1}}^2(G_{i_1}).$$

As $i_1 < i_2 < \cdots < i_m$, this is just $r_1(F \oplus G_{i_1}) \cup w_{i_1}^2(G_{i_1}) = r_1(G_{i_1}) \cup w_{i_1}^2(G_{i_1})$.

Injectivity of the multiplication map $\cup w_{i_1}^2(G_{i_1})$ in $H^*(U/\mathcal{O} \times B\mathcal{O}_{i_1}, \mathbb{Z}_2)$ then holds $r_1(F \oplus G_{i_1}) = r_1(G_{i_1})$. Then we pull this back with

$$(id \times const) : U/\mathcal{O} \rightarrow (U/\mathcal{O} \times B\mathcal{O}_{i_1}),$$

(where the map *const* takes just one, arbitrary, value), to obtain

$$r_1(f^*\gamma(\mathbb{R}^\infty) \oplus \varepsilon) = r_1(\varepsilon).$$

Due to the Whitney sum formula, the Stiefel–Whitney classes in which r_1 is a polynomial are stable under adding a trivial bundle; and the above left hand term equals $r_1(f^*\gamma(\mathbb{R}^\infty))$.

Using naturality of characteristic classes with respect to pullbacks, this shows that $r_1(\gamma(\mathbb{R}^\infty)) - r_1(\varepsilon)$ lies in ker f^*. So we can replace it with a linear (over the field with 2 elements) combination of strictly quadratic terms, providing a new decomposition,

$$c(\gamma(\mathbb{R}^\infty)) - c(\varepsilon) = \omega_{i_1}^2 \sum_{j_2=1}^{m_1} \omega_{i_{(1,j_2)}}^2 r_{(1,j_1)}(\gamma(\mathbb{R}^\infty)) + \omega_{i_1}^2 r_1(\varepsilon) + \sum_{j_1=2}^{m} \omega_{i_{j_1}}^2 r_{j_1}(\gamma(\mathbb{R}^\infty)).$$

Induction hypothesis. Consider a given decomposition

$$c(\gamma(\mathbb{R}^\infty)) - c(\varepsilon) = \left(\sum_{\vec{j}_k} r_{\vec{j}_k}(\gamma(\mathbb{R}^\infty)) \bigcup_{p \in I(\vec{j}_k)} \omega_p^2 \right) + \sum_{s=1}^{k-1} \bigcup_{n=1}^{s} \sum_{j_n=1}^{m_{\vec{j}_{n-1}}} \omega_{i_{\vec{j}_n}}^2 \cup r_{\vec{j}_n}(\varepsilon).$$

Inductive claim. The decomposition of the induction hypothesis admits a lower degree remainder that lies in ker f^*. We show this in the inductive step.

Inductive step. We truncate the equation $c(F \oplus G) = c(G)$ at the dimension

$$\ell := \min_{\vec{j} \text{ appears}} \max I(\vec{j}).$$

Then the remaining terms of $c(G_\ell) - c(\varepsilon)$ do all have the common factor $w_l^2(G_\ell)$. This is not a zero divisor in $H^*(U/\mathcal{O} \times B\mathcal{O}_\ell, \mathbb{Z}_2)$ and furthermore its multiplication map $\cup w_l^2(G_\ell)$ is injective. Now, in $c(F \oplus G_\ell) = c(G_\ell)$, this injectivity implies

$$\sum_{\vec{j} \text{ appears}}^{\max I(\vec{j}) \le \ell} r_{\vec{j}}(F \oplus G_\ell) \bigcup_{p \in I(\vec{j}) \setminus \{\ell\}} w_p^2(G_\ell) = \sum_{\vec{j} \text{ appears}}^{\max I(\vec{j}) \le \ell} r_{\vec{j}}(G_\ell) \bigcup_{p \in I(\vec{j}) \setminus \{\ell\}} w_p^2(G_\ell).$$

$\diamond$ If there is just one lower degree remainder $r_{\vec{j}}(\gamma(\mathbb{R}^\infty)) - r_{\vec{j}}(\varepsilon)$, then we use the injectivity of the multiplication map

$$\cup \left(\bigcup_{p \in I(\vec{j}) \setminus \{\ell\}} w_p^2(G_\ell) \right) \text{ on } H^*(U/\mathcal{O} \times B\mathcal{O}_\ell, \mathbb{Z}_2)$$

to obtain $r_{\vec{j}}(F \oplus G_\ell) = r_{\vec{j}}(G_\ell)$. Then we pull this back with

$$(id \times const) : U/\mathcal{O} \to (U/\mathcal{O} \times B\mathcal{O}_\ell)$$

to obtain $r_{\vec{j}}(f^*\gamma(\mathbb{R}^\infty) \oplus \varepsilon) = r_{\vec{j}}(\varepsilon)$. Using naturality, we see now that the lower degree remainder $r_{\vec{j}}(\gamma(\mathbb{R}^\infty)) - r_{\vec{j}}(\varepsilon)$ lies in ker f^*.

$\diamond$ Otherwise, we truncate the remaining equation again at the dimension

$$\ell' := \min_{\vec{j} \text{ appears}}^{\max I(\vec{j}) = \ell} \max(I(\vec{j}) \setminus \{\ell\}),$$

so as to obtain

$$\sum_{\vec{j} \text{ appears}}^{\max(I(\vec{j}) \setminus \{\ell\}) \le \ell'} r_{\vec{j}}(F \oplus G_{\ell'}) \bigcup_{p \in (I(\vec{j}) \setminus \{\ell\})} w_p^2(G_{\ell'})$$

$$= \sum_{\vec{j} \text{ appears}}^{\max(I(\vec{j}) \setminus \{\ell\}) \le \ell'} r_{\vec{j}}(G_{\ell'}) \bigcup_{p \in (I(\vec{j}) \setminus \{\ell\})} w_p^2(G_{\ell'}).$$

Now we proceed analogously with the choice marked with the "$\diamond$" signs and, after finitely many steps, find a lower degree remainder in ker f^*. This lower degree remain-

der can be replaced by a linear combination of squares, holding a new decomposition of $c(\gamma(\mathbb{R}^\infty)) - c(\varepsilon)$. This completes the induction. □

Proof of Theorem 1 (ii)⇒(i) Let c be a complexifiable characteristic class. By Remark A and the universality of $\gamma(\mathbb{R}^\infty)$, the decomposition of Lemma 2 yields the decomposition

$$c = c(\varepsilon) + \sum_{s=1}^{k-1} \bigcup_{n=1}^{s} \sum_{j_n=1}^{m_{\vec{j}_{n-1}}} w_{i_{\vec{j}_n}}^2 \cup r_{\vec{j}_n}(\varepsilon).$$

As $c(\varepsilon), r_{\vec{j}_1}(\varepsilon), \ldots, r_{\vec{j}_{k-1}}(\varepsilon)$ are elements of $\{0, 1 = w_0 = w_0^2\}$, the class c is in the sub-ring $\mathbb{Z}_2[w_i^2]_{i\in\mathbb{N}\cup\{0\}}$ of the polynomial ring of Stiefel–Whitney classes. □

This completes the proof of Theorem 1.

3 Classes in cohomology with integral coefficients

We will build on our results obtained for $\mathbb{Z}_2$-coefficients and use the mod-2-reduction homomorphism

$$\rho : \mathrm{H}^*(-, \mathbb{Z}) \to \mathrm{H}^*(-, \mathbb{Z}_2)$$

to prove the theorems with $\mathbb{Z}$-coefficients stated in the introduction. Define the element $V_I \in \mathrm{H}^*(B\mathcal{O}, \mathbb{Z})$ as in the appendix, and let v_I be the characteristic class that is V_I on the universal bundle.

Lemma 4 *For any real bundle ξ, the mod-2-reduced class $\rho(v_I^2(\xi))$ equals*

$$\left(\sum_{i\in I\cap\{\frac{1}{2}\}} w_1^2 \cup \bigcup_{j\in I\setminus\{i\}} w_{4j} + \sum_{i\in I\setminus\{\frac{1}{2}\}} (w_{4i+2} + w_2 \cup w_{4i}) \cup \bigcup_{j\in I\setminus\{i\}} w_{4j} \right) (\xi \oplus \xi).$$

Proof By Feshbach's description (in the appendix), the mod-2-reduction is

$$\rho\left(v_I^2(\xi)\right) = \left(Sq^1 \left(\bigcup_{i\in I} w_{2i}(\xi) \right) \right)^2.$$

We expand this expression until it is a polynomial in the Stiefel–Whitney classes. Then we rearrange the expression using the Whitney sum formula and the symmetry of the terms. □

Proof of Theorem 2 For $v_{\{\frac{1}{2}\}}$ and the Pontrjagin classes, the result is obvious. Now let $F \to B$, $G \to B$ be real bundles with $F^{\mathbb{C}} \cong G^{\mathbb{C}}$. Forgetting the complex

structure, this is $F \oplus F \cong G \oplus G$. By naturality of the Stiefel–Whitney classes, for any finite nonempty index set $I \subset (\{\frac{1}{2}\} \cup \mathbb{N})$, the polynomial given in Lemma 4 is the same for the arguments $(F \oplus F)$ and $(G \oplus G)$. Applying Lemma 4, this means that $\rho(v_I^2(F)) = \rho(v_I^2(G))$. As V_I^2 is in the torsion of $H^*(B\mathcal{O}, \mathbb{Z})$, restricted on which ρ is injective [3] p. 513, this proves the theorem: $v_I^2(F) = v_I^2(G)$. □

Proof of Theorem 3 Feshbach [3] p. 513 shows that

$$H^*(B\mathcal{O}, \mathbb{Z}) = \mathbb{Z}[\pi_i]_{i \in \mathbb{N}} \oplus \{\text{2-torsion}\},$$

where π_i is the i-th Pontrjagin class of the universal bundle. Then $C = P(p_i) + T$ with P a polynomial in the Pontrjagin classes p_i and T some 2-torsion class. So for every real bundle ξ,

$$\rho(C)(\xi) = P(\rho(p_i(\xi))) + \rho(T)(\xi).$$

By definition of the Pontrjagin classes, $p_i(\xi) = (-1)^i c_{2i}(\xi^{\mathbb{C}})$; and using the reduction $\rho(c_{2i}(\xi^{\mathbb{C}})) = w_{4i}(\xi \oplus \xi)$ from Chern classes to Stiefel–Whitney classes, further the Whitney sum formula and the symmetry of the summands, we deduce

$$\rho(C)(\xi) = P(w_{2i}^2(\xi)) + \rho(T)(\xi).$$

It follows from Theorem 1 that the mod-2-reduction $\rho(C)(\xi)$ is a polynomial in the squares of Stiefel–Whitney classes; and hence also $\rho(T)(\xi)$ is a polynomial $Q(w_j^2(\xi))$ in the squares of Stiefel–Whitney classes. As according to [3] p. 513, ρ is injective on the torsion elements, there is an inverse for the restricted map $\rho|_{\{\text{2-torsion}\}}$, lifting $\rho(T)$ back to T. So, from

$$T(\xi) = \rho|_{\{\text{2-torsion}\}}^{-1}\left(Q(w_j^2(\xi))\right),$$

we obtain

$$C(\xi) = P\left((-1)^i c_{2i}(\xi^{\mathbb{C}})\right) + \rho|_{\{\text{2-torsion}\}}^{-1}\left(Q\left(\rho(c_j(\xi^{\mathbb{C}}))\right)\right).$$

Appendix: The cohomology ring of $B\mathcal{O}$ with $\mathbb{Z}$-coefficients

The cohomology ring of $B\mathcal{O}$ with $\mathbb{Z}$-coefficients is known since Thomas [5,6] and with all relations between its generators since Brown [1] and Feshbach [3]. It can be derived as follows. Define the set of generators of $H^*(B\mathcal{O}_n, \mathbb{Z})$ as in [3, definition 1]:

It consists of the Pontrjagin classes p_i of the universal bundle over $B\mathcal{O}_n$, and classes V_I with I ranging over all finite nonempty subsets of

$$\left\{\frac{1}{2}\right\} \cup \left\{k \in \mathbb{N} \,\middle|\, 0 < k < \frac{n+1}{2}\right\}$$

with the proviso that I does not contain both $\frac{1}{2}$ and $\frac{n}{2}$, for $n > 1$.

According to [3, theorem 2], $\mathrm{H}^*(B\mathcal{O}_n, \mathbb{Z})$ is for all $n \leq \infty$ isomorphic to the polynomial ring over $\mathbb{Z}$ generated by the above specified elements modulo the ideal generated by the following six types of relations.

In all relations except the first, the cardinality of I is less than or equal to that of J and greater than one. On the index sets I and J, we perform set-theoretic unions ($\cup$), intersections ($\cap$) and differences ($\setminus$). By convention, $p_{\frac{1}{2}}$ where it occurs means $V_{\left\{\frac{1}{2}\right\}}$. Also, if $\left\{\frac{n}{2}, \frac{1}{2}\right\} \subset I \cup J$, then $V_{I \cup J}$ shall mean $V_{\left\{\frac{n}{2}\right\}} V_{(I \cup J) \setminus \left\{\frac{n}{2}, \frac{1}{2}\right\}}$. As Feshbach remarks, most of the restrictions on I and J are to avoid repeating relations.

1) $2V_I = 0$.
2) $V_I V_J + V_{I \cup J} V_{I \cap J} + V_{I \setminus J} V_{J \setminus I} \prod_{i \in I \cap J} p_i = 0$ (for $I \cap J \neq \emptyset$, $I \nsubseteq J$).
3) $V_I V_J + \sum_{i \in I} V_{\{i\}} V_{(J \setminus I) \cup \{i\}} \prod_{j \in I \setminus \{i\}} p_j = 0$ (for $I \subset J$).
4) $V_I V_J + \sum_{i \in I} V_{\{i\}} V_{(I \cup J) \setminus \{i\}} = 0$ (for $I \cap J = \emptyset$; if I and J have the same cardinality, then the smallest element of I is to be less than that of J).
5) $\sum_{i \in I} V_{\{i\}} V_{I \setminus \{i\}} = 0$.
6) $V_{\left\{\frac{1}{2}\right\}} p_{\frac{n}{2}} + V_{\left\{\frac{n}{2}\right\}}^2 = 0$, if n is even.

Then $\rho(V_I) = Sq^1(\bigcup_{i \in I} w_{2i})$.
