THE SUMMIT OF THE CBR AT MM WAVELENGTHS AND OTHER QUERIES

J. P. Vallee

Herzberg Institute, NRCC, Ottawa, Ont., Canada K1A 0R6

Summary

As a strategy for the Search for Extraterrestrial Intelligence (SETI), a renewed proposal is made to look at the summit of the Cosmic Background Radiation (CBR). The CBR peaks near 1.85 mm in the frequency spectrum of the Universe and near 1.05 mm in the wavelength spectrum of the Universe. I review the current status (best CBR temperature, best receivers, etc).

In addition, a modelling approach to existentialist questions and SETI is developed briefly, as a game. Existentialist "answers" (religious, scientific) are tabulated for questions on the Universe, Life, the Mind, according to their various choices.
