Maximum Entropy Two-Station Cyclic Queues with Multiple General Servers

Demetres D. Kouvatsos and John Almond

Schools of Computing, University of Bradford, Bradford, West Yorkshire, BD7 1DP, United Kingdom

On page 242, paragraph ii) should read:

ii) a bulk service-time distribution with an underlying counting process equivalent to a compound Poisson process (M^B) with parameter $2\mu/(1 + C_s^2)$ and geometrically distributed bulk sizes with mean, $(1 + C_s^2)/2$, and squared coefficient of variation, $(C_s^2 - 1)/(C_s^2 + 1)$.
