**Dipropylacetate-induced quasi-morphine abstinence behaviour in the rat:
Suppression by α_2 -adrenoceptor stimulation**

J. W. van der Laan, G. Weick, and F. C. Hillen

Psychopharmacology (1983) 81:267–271

Due to an error in the revision of the manuscript, the revised Fig. 4, which is now reproduced below, was not originally published.

Fig. 4. Effect of α -agonists on body shakes and locomotor activity induced by DPA. All compounds were given intraperitoneally 10 min before treatment with DPA (300 mg/kg IP). $\circ$ — $\circ$, BHT-920; $\square$ — $\square$, clonidine; $\blacksquare$ — $\blacksquare$, guanfacine; $\bullet$ — $\bullet$, azepevole; $\triangle$ — $\triangle$, ST-587. Differences were tested using the Mann-Whitney *U*-test (one-tailed). * $P < 0.05$; + $P < 0.02$, ° $P < 0.001$. Bars represent SEM as percentage of the control value
