Dept. of Microbiology, University of Toronto, Ontario M5S 1A8, Canada

On page 141 in Fig. 1a the ● 1.29 mM/l ($3\times$ NEDF) points were not included in the graph. Below is given the correct presentation of the Figure.

Fig. 1. Representative growth curves for *N. gonorrhoeae* strains in NEDF. (a) The prototype was grown in NEDF having the following proline concentrations: ■ proline absent, ▲ 0.43 mM/l (normal NEDF proline concentration), ● 1.29 mM/l ($3\times$ NEDF). Thia- in the different concentrations of proline is represented as such ---△---. (b) The pro- was grown in different concentrations of proline: ▲ 0.43 mM/l, ● 1.29 mM/l ($3\times$ NEDF), ○ 1.72 mM/l ($4\times$ NEDF).
