Factors Affecting Persistence of Deaf College Students,
Research in Higher Education 27(3):244–258 (1987)

Michael S. Stinson, Marcia J. Scherer, and Gerard G. Walter

Three of the maximum likelihood estimates in Figure 2, “Revised Model of Factors Affecting College Persistence with Maximum Likelihood Estimates,” page 252, are incorrect. The value shown for the path between distance from home and participation in sponsored college activities is $-.13, p < .05$; the correct value is $-.01, p > .10$. The value shown in Figure 2 for the path between distance from home and persistence in college is $-.13, p < .05$; the correct value is $-.08, p > .10$. The interpretation of the correct values is that there is no relationship between distance from home and students’ persistence. This interpretation replaces that on page 254, lines 27–38. In addition, the value shown for the path from social satisfaction to participation in sponsored college activities is $-.13, p < .05$; the correct value is $.17, p < .05$.
