ACKNOWLEDGEMENT

This volume contains sixteen papers presented at a symposium, organised in April 1969 by the Laboratory of Plant Physiology of the Research Station of Gorsem and sponsored by the „Instituut ter Aanmoediging van het Wetenschappelijk Onderzoek in Nijverheid en Landbouw” (I.W.O.N.L., Brussels). This conference was held at the „Hoger Instituut voor Scheikunde en Tuinbouw”, Sint-Truiden, Belgium.

Ripening and senescence of fruits were discussed from a biochemical point of view. This subject is related to the fundamental problems of senescence of plant material; however, manifold horticultural problems of fruit storage and storage disorders are basically biochemical problems. The objective of the symposium was to promote interpenetration between these two fields of research.

The Belgian Ministry of National Education, the Province of Limburg and the Municipality of Sint-Truiden generously provided financial support for this meeting. Inaugural addresses were given by Ingenieur P. Nicolai, President of the Research Station of Gorsem and by Professor C. Sironval, director of the organising laboratory. The organisers thank Professor W. Schuphan, Geisenheim, for translating most of the summaries in German. A great deal of the translation of the French summaries was carried out by Dr. M.-R. Michel-Wolwertz, Dr. E. Dujardin, Dr. R. Marcelle and Dr. J.-M. Michel from the organising laboratory. Mr. W. Brugmans, R. Geukens, J. Michiels and J. Treunen did most of the work behind the scenes.

The collaboration of all these persons and organisms is gratefully acknowledged.

H. CLIJSTERS
