In the paper [Math. Z. **196**, 331–342 (1987)], Theorem 1.2 contained some printing errors. The text should have read as follows:

Theorem 1.2. *Let μ be a finite regular Borel measure on the compact space G and let $\{g_j\}$ be a sequence in $L^1(\mu)$.*

(i) Let $e(j)$ be such that $\sup |e(j) \int g_j \mathbf{1}_F d\mu| < \infty$ for all compact subsets F of G . If the L^1 -norms of the g_j are bounded away from 0, then e is bounded.

(ii) If for any function e , $\sup |e(j) \int g_j \mathbf{1}_F d\mu| < \infty$ for all compact subsets F of G implies that the function e is bounded, then the L^1 -norms of the g_j are bounded away from 0.
