On the lack of experimental evidence for certain structures in polymers

Progr Colloid Polym Sci 75:1-3 (1987)

Z. Rigbi

Technion-Israel Institute of Technology, Haifa, Israel

Abstract: The direct experimental evidence supporting some of the structures which are postulated to exist in polymers is examined and found lacking, although circumstantial evidence may be strong. An appeal is made for experiments which will develop direct evidence for these structures.

Key words: Catenates, reptation, model structures, transection.
