CD4⁺ T lymphocytes infiltrating human breast cancer recognise autologous tumor in an MHC-class-II restricted fashion

In: Cancer Immunol Immunother (1995) 40: 1–9

We would like to make two corrections to our previously published paper (Cancer Immunol Immunother 40: 1–9, above title):

1. The anti-breast cancer activity of TIL 1288 in Fig. 1 (p 4) is completely specific for the autologous tumor based on repeated assays of TNF- α -secretion (see new Fig. 1, *left*). However, two of nine allogeneic EBV-B cell
2. In Fig. 3 (p 5) of our published paper, the value 895/pg/ml was erroneously transcribed as 1895 pg/ml. Thus, there is no convincing data that the reactivity of TIL from patient 1392 is tumor specific.
