Screening for known mutations in the LDL receptor gene causing familial hypercholesterolemia

Hum Genet (1995) 95:671–676

In the study a novel mutation was detected that changes codon 541 from TGG to TGA. The mutation was reported in the paper to change this codon from serine to the TGA stop codon. Accordingly, the mutation was named S541X. However, TGG is the codon for tryptophan and not for serine. Thus, the mutation is W541X and not S541X.
