ERRATUM

To the paper by D. M. MacKay and W. S. McCulloch entitled "The Limiting Information Capacity of a Neuronal Link" (Vol. 14, p. 131).

In the above paper the statement that all n values of T_s should ideally be used with equal frequency is true only if pulse-*position* modulation is used. With pulse-*interval* modulation it is advantageous to use smaller values of T_s more often. The improvement that can be effected does not, however, affect the order of magnitude of the results, and only reinforces our qualitative conclusions.
