**Photon-Photon Scattering and Photon-Scalar Particle Scattering
via Gravitational Interaction (One-Graviton Exchange)
and Comparison of the Processes
between Classical (General-Relativistic) Theory
and the Quantum Linearized Field Theory.**

D. BOCCALETTI, V. DE SABBATA, C. GUALDI and P. FORTINI

(Nuovo Cimento, 60 B, 320 (1969))

In formula (12) a factor $[(W-K)/W]^2$ is missing and therefore in formula (13) the factor $W^4/(W-K)^2$ must be replaced by W^2 .

The last sentence at page 328 must read:

« The difference with the quantum cross-section is no more a factor 4 but a factor $(W/K)^2$. That is, the classical angle must be multiplied by K/W to have the quantum deflection angle. This factor $K/W = v/(1-v)$ depends on the fact that in the classical case we have a fixed pencil, and it becomes clear when one thinks of the "reduced energy" of the system photon-particle (both moving) ».

Then the sentence in pag. 329 must be disregarded.
