(*Nuovo Cimento B*, 105, 1103 (1990))

PACS 03.65.Bz – Quantum mechanics; quantum measurements.
PACS 99.10 – Errata.

On p. 1104, 1st line from below, the expression

$$P(X_i = 1, X_j = 1) = p$$

should read

$$P(X_i = 1, X_i = 1) = p.$$

On p. 1105, 11th and 12th line from below, the expression

$$[p - \eta \Delta p, p - (\Delta p)'' \cup (p + (\Delta p)'', p + (\Delta p)'']$$

should read

$$[p - \eta \Delta p, p - (\Delta p)''] \cup (p + (\Delta p)'', p + (\Delta p)'').$$

On p. 1107, 6th line from above, the expression

$$[p - (pq)^{1/2} N^k, p - (pq)^{1/2} N^n] \cup (p + (pq)^{1/2} N^n, p + (pq)^{1/2} N^k],$$

should read

$$[p - (pq)^{1/2} N^k, p - (pq)^{1/2} N^n] \cup (p + (pq)^{1/2} N^n, p + (pq)^{1/2} N^k).$$

On p. 1110, 11th line from below, «possibiities» should read «possibilities».

On p. 1110, 4th line from below, «and given» should read «and is given».

Due to a technical inconvenience, on p. 1109 the last two lines are doubled; and on p. 1110, 1st line from below:

Thus we reach the conclusion that quantum YES-NO measurements of the dis-should read:

Thus we reach the conclusion that quantum YES-NO measurements of the discrete spin observables considered is repeatable with respect to individual measured systems, if and only if $G(p)$ is jump discontinuous in the sense of point 3 above.

In general, for spin s and its projection m we have $p = p_{mm}^s = (\mathcal{G}_{mm}^s)^2$, where $\mathcal{G}_{mm}^s$ is an element of the rotation matrix. It is not difficult to show that $G(p_{mm}^s)$ has a finite

We sincerely apologize to the author.
