We wish to point out an error committed in the numerical computations regarding the c.m. and Coulomb corrections of the nuclear Hamiltonian.

This led us to overestimate the above corrections, without, however, altering substantially our proceeding conclusions. Actually, the correct energy values for ${}^4\text{He}$ are $E_{\text{HF}} = -14.05$ MeV and $E_+ = -15.01$ MeV; the corresponding expansion coefficients X_{ni} of Table I are, *e.g.*, $X_{00} = 0.972$ and $X_{01} = 0.230 i$. For ${}^{16}\text{O}$ we have $E_{\text{HF}} = E_+ = -96.59$ MeV.
