When the momentum transfer is not very small eq. (1') of our paper has to be changed as follows

$$\left(\frac{d^3\sigma_{el}}{dE_f dE_r d\Omega_e} \right)_{180^\circ} = \text{const} \frac{K_e^2}{K^2} \frac{E_f^2}{v_e(K_v^2 - K_{e_0}^2)} \frac{d\sigma_{ph}}{dE_r}$$

where K_e is the momentum transfer of the electron K is the momentum transfer of the photon corresponding to the same relative energy E_r of the outgoing particles.
