as the results of introgression. Processes are suggested, by means of which introgression involving a sterile parent could take place. Man's influence both in transporting the parents and progeny over large distances between islands and in shaping the resulting populations, is discussed. Desirability of a much more intensive study, both morphological and experimental, is stressed. The fact that such a study is being undertaken by Dr. Barrau is announced with satisfaction.

CORRECTION

In the issue of *Brittonia* for October, 1959 (volume 11, page 196), in an article by Peter H. Raven and Harlan Lewis, the editor unfortunately transposed the upper and lower parts of the page.

The last 24 lines, beginning "these strains are primarily self-pollinating . . .", should be transferred to the top of the page.
