(*Nuovo Cimento B*, **77**, 10 (1983))

After our paper ⁽¹⁾ appeared we realized that GHIRARDI, OMER, WEBER and RIMINI ⁽²⁾ had already argued that according to quantum mechanics there can be no instantaneous measurements, so that the Zeno paradox cannot occur. Although their reasoning, based on the energy spread, differed from ours, we ought to have been aware of it. Another two papers relevant to the question are those of Barchielli, Lanz and Prosperi ⁽³⁾ and of Lupieri ⁽⁴⁾. One of us (AJK) is grateful to Profs. P. CALDIROLA, G. C. GHIRARDI, L. LANZ and T. WEBER, for the above references as well as for useful discussions on the underlying fundamental problems.
