Again, the new linguistic model questions the need and advantage of descriptions and interpretations of psychological behavior that uses such analogous and metaphorical terms from machine technology as "input," "output," "feedforward," and "feedback."

Finally, when applying the linguistic model to psychological writings labeled humanistic, phenomenological, existential, or personalistic and taking into account the intellectual background and competence of the writers, it can be estimated how much the writers attempt to enlarge the scope of psychological observation and how much they actually foster animism in psychological theory and practice.
