T cell receptor V α and V β gene usage by tumour-infiltrating lymphocytes in oral squamous cell carcinoma

In: Cancer Immunol Immunother (1996) 43: 10–18

In the above article in both Fig. 1 (p 12) and Fig. 2 (p 14) the upper panels appeared in a reversed order. The correct figures should have appeared as below:

Fig. 1 The expression of T cell receptor (TCR) V α gene transcripts in tumour-infiltrating lymphocytes (TIL) and peripheral blood mononuclear cells (PBMC) from patient 9. Upper section autoradiographs of the polymerase chain reaction (PCR) products for each V α gene family. V α gene transcripts amplified by PCR through 27 cycles were loaded onto 1.8% agarose gel, transferred to a filter and then hybridized with a 32 P-labelled C α probe, as outlined in Materials and methods.

Fig. 2 The expression of TCR V β gene transcripts in TIL and PBMC from patient 9. Upper section autoradiographs of the PCR products for each V β gene family. V β gene transcripts amplified by PCR through 27 cycles were loaded onto 1.8% agarose gel, transferred to a filter and then hybridized with a 32 P-labelled C β probe, as outlined in Materials and methods.
