Due to a technical problem, the equation in the legend of Fig. 1 was incomplete. The correct legend should be as follows:

Fig. 1. Proportion ($\pm$ SE) of female kids produced according to maternal age by mountain goats on Caw Ridge, Alberta, 1989–1997. Sample sizes are shown for each age class. The *regression line* is from a generalized linear mixed model including maternal age as a fixed effect and female identity as a random effect ($P=e^k/(1+e^k)$, where $k=0.063 \pm 0.171 - (0.280 \pm 0.076) * (\text{age}-8) + e_j$, and $e_j \sim N(0, 0.05 \pm 0.26)$))
