To reduce the variation interval of x in Fig. 1, the scaling factor $k = 1.6 \times 10^{-4}$ has been introduced. Multiplying the interval (544.22, 66076.98) by k , we have the interval (0.0870, 10.57) which contains the value of $|\Sigma_1| = 0.6645$, as expected.
