Culture of reconstructed epidermis in a defined medium at 33° C shows a delayed epidermal maturation, prolonged lifespan and improved stratum corneum

In: Arch Dermatol Res (1997) 289: 585–595

Due to an error which occurred in the printing process Figure 5D was not printed. Reprints with corrected Figure 5 are available through the author.

Fig. 5A–G Regulation of keratin 6 expression by EGF, TGF α , KGF and bFGF. Cultures were grown at the air-liquid interface for 2 weeks in medium II in the absence (A) or presence (B) of 10 ng/ml EGF, or in medium I (C–G) without additional growth factors (C), or in the presence of 10 ng/ml EGF (D), TGF α (E), KGF (F) and bFGF (G). Immunohistochemical staining with antikeratin 6 was performed as described in Materials and methods
