The aim of this book, which also includes a video of a surgical case, is to show important procedures in endoscopic step-by-step dissection in the cadaver laboratory.

The result is a book containing six chapters starting with an introduction to endoscopic sinonasal surgery, discussing instrumentation and patient positioning, considering antero-posterior versus posteroanterior approach, the importance of focusing on anatomical landmarks, basic endoscopic sinonasal dissection and advanced endoscopic sinonasal dissection. The latter involving extended approaches to the orbit, optic nerve, pterygomaxillary fossa and anterior skull base.

The illustrations are all of high quality. There is an introduction to each chapter and a special focus on vital landmarks. An extended reference list contains an update on important studies published within the field of endoscopic endonasal surgery.

This book is considered of vital importance both to residents and experienced surgeons and is hereby highly recommended.
