The international workshop on holography in 2015 (IWH2015) is the ninth workshop which covers all the aspects on holographic memories, display, sensing, and imaging. Optical memory and display are most significantly developed areas in optical technology closely related to our life. Because of rapid growth of digital technologies such as computer, network, and imaging devices, holographic technologies are still expected to serve as a key

role. Recently, digital holography is one of the attractive research fields of sensing and imaging. IWH2015 is jointly organized by Center for Optical Research and Education (CORE), Utsunomiya University and Optical Society of Japan. We hope that this special issue provides fruitful information to the readers of optical review.
