Fig. 1 Zinc accumulation and neuronal degeneration in human temporal cortical neurons following acute carotid artery infarction. Human cortex sections from normal brain (**a**, **c**) or from ischemia temporal (**b**, **d**) tissue were stained with AMG (**a**, **b**) and H&E (**c**, **d**). Compare with the normal cortex (**a**), large amounts of AMG

enhanced zinc–sulphur nanocrystals positive neurons were seen in the ischemia brains (**b**). Sections of the same samples were stained with H&E. Under H&E, these AMG-positive neurons show injured appearance, e.g. vacuolar degeneration and karyolysis. All sections were 15 μm thick. Scale bar 50 μm
