1 Preface

This volume of the *Annals of Operations Research*, contains a collection of papers published in memory of Peter L. Hammer (1936–2006).

As we recall further down, Peter made substantial contributions to several areas of operations research and discrete mathematics, including, in particular, mathematical programming (linear and quadratic 0–1 programming, pseudo-Boolean optimization, knapsack problems, etc.), combinatorial optimization (transportation problems, network flows, MAXSAT, simple plant location, etc.), graph theory (special classes of graphs, stability problems, and their applications), data mining and classification (Logical Analysis of Data), and, last but not least, Boolean theory (satisfiability, duality, Horn functions, threshold functions, and their applications).

The Call for Papers invited authors to submit research papers in all of these areas. We were very happy to receive a large number of high quality submissions along the lines explored by Peter, and eventually we selected 22 original contributions to appear in this special

volume. We have no doubt that he would have been very proud of this collection of papers, and we are happy to dedicate it to him.

We would like to thank all authors of this special volume for their contributions, all our enthusiastic experts who served as volunteer referees for their help in selecting and improving these submissions, and Ms. Katie D'Agosta, the Managing Editor of the journal, for her continuous support and help with this volume.

Unfortunately, shortly before the volume was completed, fate struck again: On October 10, 2010, our dear friend and co-editor Bruno Simeone (born in 1945) passed away unexpectedly. Bruno was one of Peter Hammer's first doctoral students, and one of his closest and most faithful friends. He obtained his Ph.D. at the University of Waterloo in 1979, with a thesis entitled *Quadratic 0–1 Programming, Boolean Functions and Graphs*. Throughout the years, he remained in continuous contact with Peter, and together they co-authored about 30 scientific papers. Besides being a creative and dedicated researcher, Bruno was a friendly and cheerful person. He is deeply missed by all those who knew him.

Peter Ladislaw Hammer was born in Timisoara, Romania, on December 23, 1936. He earned his doctorate in mathematics under Academician Grigore C. Moisil at the University of Bucharest in 1966. He defected to Israel in 1967 where he became a professor at the Technion in Haifa. After moving to Canada, he taught from 1969 to 1972 at the University of Montréal, and from 1972 to 1983 at the University of Waterloo. In 1983, he moved to the USA and became a professor at Rutgers University, where he founded RUTCOR—the Rutgers Center for Operations Research. He remained the director of RUTCOR until his untimely death in a tragic car accident on December 27, 2006.

For more than 40 years, Peter Hammer ranked among the most influential researchers in the fields of operations research and discrete mathematics. He made numerous major contributions to these fields, launching several new research directions. His results have influenced hundreds of colleagues and have made a lasting impact on many areas of mathematics, computer science, and statistics.

Most of Peter Hammer's scientific production has its roots in the work of George Boole on propositional logic. More than anyone else, Peter Hammer used and extended Boole's *machina universalis* to handle questions relating to decision making, analysis, and synthesis as they arise in natural, economic, and social sciences. Over the span of his scientific career, he conducted eclectic forays into the interactions between Boolean methods, optimization, and combinatorial analysis, while adapting his investigations to the most recent advances of mathematical knowledge and of various fields of application. Among the main research topics which received his attention, one finds an impressive array of methodological studies dealing with combinatorial optimization, some excursions into logistics and game theory, numerous contributions to graph theory, to the algorithmic aspects of propositional logic, to artificial intelligence and to the development of innovative data mining techniques. We include a complete bibliography at the end of this Preface.

At the onset of his career, as a researcher at the Institute of Mathematics of the Academia of Romania, Peter Hammer wrote several important articles on transportation problems, jointly with Egon Balas. At the same time his advisor, Grigore Moisil, directed him to the study of Boolean algebra. In this field, a central role is played by functions depending on binary variables, and taking either binary values (i.e., Boolean functions) or real values (i.e., pseudo-Boolean functions). In a series of papers, Peter Hammer demonstrated that a large variety of important problems of operations research, combinatorics, and computer science can be reduced to the optimization of pseudo-Boolean functions under constraints described by a system of pseudo-Boolean inequalities. A further main conceptual step in his work was the characterization of the set of feasible solutions of the above system as solutions of a single Boolean equation (or, equivalently, of a satisfiability problem). This led him, in joint work with Ivo Rosenberg and Sergiu Rudeanu, to the development of an original approach inspired from classical Boolean methods for the solution of a large variety of discrete optimization problems.

This research project culminated in 1968 with the publication of the book *Boolean Methods in Operations Research and Related Areas* (Springer-Verlag, 1968), co-authored by Sergiu Rudeanu. This landmark monograph, which founded the field of pseudo-Boolean optimization, has influenced several generations of students and researchers, and is now considered a “classic” in operations research.

In a sense, Peter Hammer's early work can be viewed as a forerunner of subsequent developments in the theory of computational complexity, since it was in effect demonstrating that a large class of combinatorial optimization problems is reducible to the solution of Boolean equations. However, this purely “reductionist” view of his work would be quite narrow. In fact, Peter Hammer systematically used the “canonical” representation of various

problems in terms of Boolean functions or Boolean equations to investigate the underlying structure, the “essence” of the problems themselves. More often than not, this goal is met through a simplifying process based, once again, on the tools of Boolean algebra. This approach provides, for instance, a simple way to demonstrate that every system of linear inequalities in binary variables is equivalent to a set of inequalities involving only 0, 1, -1 coefficients, as observed in a joint paper by Frieda Granot and Peter Hammer (1972). It also led Peter Hammer, Ellis Johnson, and Uri Peled (1975) to early investigations into the facial structure of knapsack polyhedra.

In a related stream of research, Peter Hammer established numerous fruitful links between graph theory and Boolean functions. In a famous joint paper with Vašek Chvátal on the aggregation of inequalities in integer programming (1977), he introduced and characterized the class of threshold graphs, inspired by threshold Boolean functions. Threshold graphs have subsequently been the subject of scores of articles and of a book by N.V.R. Mahadev and Uri Peled, two of Peter Hammer’s former doctoral students. Other links between graphs and Boolean or pseudo-Boolean functions were explored in joint work with Claude Benzaken, Dominique de Werra, Christian Ebenegger, Stephan Foldes, Toshihide Ibaraki, Alex Kelmans, Vadim Lozin, Frédéric Maffray, Bruno Simeone, and others.

Quadratic 0-1 optimization was one of Peter Hammer’s main fields of investigation. The theory of roof-duality (1984), jointly developed with Pierre Hansen and Bruno Simeone, builds on concepts from linear programming (linear relaxations), Boolean theory (quadratic Boolean equations) and networks flows (maximum flow problems) to compute best linear approximations of quadratic pseudo-Boolean functions and tight bounds on their maximum value. Further research along similar lines was conducted by Peter Hammer in collaboration with Endre Boros, Jean-Marie Bourjolly, Yves Crama, Michel Minoux, David Rader, Gabriel Tavares, Xiaorong Sun, and others.

Peter Hammer was also interested in the application of Boolean models in artificial intelligence and related fields, as witnessed by numerous papers or edited volumes coauthored with Gabriela and Sorin Alexe, Martin Anthony, Tiberius Bonates, Endre Boros, Yves Crama, Oya Ekin, Marty Golumbic, Vladimir Gurvich, Lisa Hellerstein, John Hooker, Toshihide Ibaraki, Alex Kogan, Miguel Lejeune, Irina Lozina, Kaz Makino, and other coworkers. His contributions bear on automatic theorem proving, compression of knowledge bases, algorithms for special classes of satisfiability problems, etc. About 20 years ago, he launched an innovative approach to data mining based on a blend of Boolean techniques and combinatorial optimization. The basic tenets of this approach were presented in a joint paper with Yves Crama and Toshihide Ibaraki (1988) and were subsequently developed by Peter Hammer and his co-workers into a new broad area of research, which he dubbed *Logical Analysis of Data*, or LAD for short. The effectiveness of the LAD methodology has been validated by many successful applications to data analysis problems. In particular, some front-of-the-line medical centers use LAD in the practice of medical diagnosis for a variety of syndromes.

Many aspects of Peter Hammer’s contributions to the study of Boolean functions and their combinatorial structure can be found in a monograph entitled *Boolean Functions: Theory, Algorithms, and Applications* (Cambridge University Press, New York, 2011), coauthored with Yves Crama and containing contributions by several other close collaborators.

Beside his scientific production, Peter Hammer will undoubtedly be remembered for his vigorous contribution to and promotion of discrete mathematics and operations research. He was the founder and editor-in-chief of several highly-rated professional journals, including *Annals of Discrete Mathematics*, *Annals of Operations Research*, *Discrete Applied Mathematics*, *Discrete Mathematics*, *Discrete Optimization*, and the *SIAM Monographs on Discrete Mathematics and Applications*. At Rutgers University, Peter Hammer was the founding

Director of the operations research program, and he was largely responsible for developing RUTCOR into an internationally recognized center of excellence and an open institute, where seminars, workshops, graduate courses, and a constant flow of visitors create a stimulating research environment. He was also a tireless organizer of professional conferences and workshops, where he always made sure to provide opportunities for interactions between experienced scientists and younger researchers.

The importance of Peter Hammer's scientific contribution was acknowledged by the award of numerous international distinctions, including the "George Tzitzeica" prize of the Romanian Academy of Science (1966), the Euler Medal of the Institute of Combinatorics and its Applications (1999), and honorary degrees from the Swiss Federal Institute of Technology in Lausanne (1986), the University of Rome "La Sapienza" (1998), and the University of Liège (1999). He was a Fellow of the American Association for the Advancement of Science since 1974, and a Founding Fellow of the Institute of Combinatorics and its Applications. Several conferences were organized in his honor, including the First International Colloquium on Pseudo-Boolean Optimization (Chexbres, Switzerland, 1987), the Workshop and Symposia Honoring Peter L. Hammer (Caesarea Rothchild Institute, University of Haifa, 2003), and the International Conference on Graphs and Optimization (GO V, Leukerbad, Switzerland, 2006).

Peter Hammer was not only an outstanding scholar and a tireless organizer, but also a kind, generous, and humorous human being. He relished the interaction with students and colleagues, and made everybody feel comfortable to work with him, be it on a mathematical question (which he was always keen to formulate) or on planning a conference. He had a talent for enrolling and motivating non-mathematicians to collaborate with him, which often led to original and innovative results, as illustrated by his joint work with economists, management scientists, and medical doctors. He supervised numerous graduate students with respect and fatherly understanding, considering each one of them as his "best student."

Peter Hammer was also a true "citizen of the world": born in Romania to a Hungarian family, he subsequently took Canadian citizenship, followed by US citizenship, wrote joint papers with coauthors from about 30 different countries, fluently spoke 6 languages (or more), traveled the world extensively, spent extended periods of time in Belgium, France, Israel, Italy, Russia, Switzerland, and many other countries, and developed an extended network of friends and coworkers on all continents.

3 List of publications of Peter L. Hammer

3.1 Books

1. Pseudo-Boolean Programming and Applications. Lecture Notes in Mathematics, Vol. 9, Springer Verlag, Berlin/Heidelberg/New York, 1965, 50 pages.
2. Boolean Techniques for Bivalent Programming (with S. Rudeanu). Lecture Notes in Mathematics, Vol. 23, Springer Verlag, Berlin/Heidelberg/New York, 1966, 120 pages.
3. Boolean Methods in Operations Research and Related Areas (with S. Rudeanu). Springer Verlag, Berlin/Heidelberg/New York, 1968, 330 pages. Edition française: Dunod, Paris, 1970.
4. Boolean Models and Methods in Mathematics, Computer Science, and Engineering (Editor with Y. Crama), Cambridge University Press, New York, NY, 2010, xviii + 759 pages.
5. Boolean Functions: Theory, Algorithms, and Applications (with Y. Crama). Cambridge University Press, New York, NY, 2011, xxii + 675 pages.

3.2 Forthcoming book

6. Pseudo-Boolean Functions (with E. Boros and Y. Crama). Cambridge University Press, forthcoming 2012.

3.3 Edited volumes

7. Mathematical Programming in Theory and Practice (Editor, with G. Zoutendijk). North Holland Publishing Co., Amsterdam, 1974, 480 pages.
8. Studies in Integer Programming (Editor with E.L. Johnson, B. Korte and G. Nemhauser). North Holland Publishing Co., Amsterdam, 1977, 562 pages.
9. Discrete Optimization I II (Editor with E.L. Johnson and B. Korte). North Holland Publishing Co., Amsterdam, 1979, 299 & 453 pages resp.
10. Horn Logic, Search and Satisfiability. Annals of Mathematics and Artificial Intelligence, Volume 1, 1990 (Editor with M. Golumbic, P. Hansen and T. Ibaraki). J.C. Baltzer Scientific Publishing Co., Switzerland, 372 pages.
11. Boolean Functions. Discrete Applied Mathematics, Volumes 96–97, 1999 (Editor with E. Boros), Elsevier Publishing, Amsterdam, 236 pages.
12. Boolean Functions and Related Problems. Discrete Applied Mathematics, Volume 107, 2000, Elsevier Publishing, Amsterdam, 262 pages.
13. Discrete Optimization DO'99: Surveys on the State of the Art. Discrete Applied Mathematics, Volume 123, 2002, and Topics in Discrete Mathematics 11, 2003 (Editor with E. Boros), Elsevier Publishing, Amsterdam, 580 pages.
14. Contributions to Discrete Optimization. Discrete Applied Mathematics, Volume 124, 2002 (Editor with E. Boros), Elsevier Publishing, Amsterdam, 142 pages.
15. Boolean and Pseudo-Boolean Functions. Discrete Applied Mathematics, Volume 142, 2004. Elsevier Publishing, Amsterdam, 205 pages.
16. Discrete Mathematics and Data Mining. Discrete Applied Mathematics, Volume 144, 2004 (Editor with M. Anthony, E. Boros, and A. Kogan). Elsevier Publishing, Amsterdam, 227 pages.
17. Boolean and Pseudo-Boolean Functions. Discrete Applied Mathematics, Volume 149, 2005. Elsevier Publishing, Amsterdam, 218 pages.
18. Discrete Mathematics and Data Mining II. Discrete Applied Mathematics, Volume 154 (7), 2006 (Editor with M. Anthony, E. Boros, and A. Kogan), Elsevier Publishing, Amsterdam, pp. 1037–1156.
19. Discrete Mathematics and Data Mining II, Discrete Applied Mathematics, Volume 156 (6), 2008 (Editor with M. Anthony, E. Boros, and A. Kogan), Elsevier Publishing, Amsterdam, pp. 823–984.

3.4 Published papers

20. Groups with Finite Classes of Conjugate Elements. Diploma Work. (Appro = M.Sc. Thesis). University of Bucharest, Dept. of Mathematics and Mechanics, 1958.
21. Infinite Rings with Finite Factorizations. Com. Acad. RPR, 9, 1959, 233–235.
22. Mathematics and the Planning of Transportations. Probl. Automatica, 2, 1960, 47–55 (with E. Balas).
23. Linear Programming and Transportation. Rev. Statistica, 9, 1960, No. 7, 43–61 (with E. Balas).
24. Transportation Problems with Related Centres. Stud. Cerc. Matem., 11, 1960, No. 2, 439–450 (with E. Balas).

202. Equational characterizations of Boolean function classes. *Discrete Mathematics* 211, 2000, 27–51 (with O. Ekin, S. Foldes and L. Hellerstein).
203. Monotone, Horn and Quadratic Pseudo-Boolean Functions. *Journal of Universal Computer Science* 6, no. 1, 2000, 97–104 (with S. Foldes).

204. An implementation of Logical Analysis of Data. *IEEE Transactions on Knowledge and Data Engineering* 12, no. 2, 2000, 292–306 (with E. Boros, T. Ibaraki, A. Kogan, E. Mayoraz and I. Muchnik).
205. Boolean normal forms, shellability and reliability computations. *SIAM Journal on Discrete Mathematics* 13, no. 2, 2000, 212–226 (with E. Boros, Y. Crama, O. Ekin, T. Ibaraki and A. Kogan).
206. Convexity and Logical Analysis of Data. *Theoretical Computer Science* 244, 2000, 95–116 (with O. Ekin and A. Kogan).
207. Evaluation, strength, and relevance of variables of Boolean functions. *SIAM Journal on Discrete Mathematics* 13, no. 3, 2000, 302–212 (with A. Kogan and U. Rothblum).
208. Disjunctive and conjunctive normal forms of pseudo-Boolean functions. *Discrete Applied Mathematics* 107, 2000, 1–26 (with S. Foldes).
209. Saturated systems of homogeneous boxes and the Logical Analysis of Numerical Data. In: *Proc 24th Annual Conference, German Gesellschaft für Klassifikation*, Passau, 2000 (with Y. Liu, B. Simeone and S. Szedmak).
210. Maximally disjoint solutions of the set covering problem. *Journal of Heuristics* 7, 2001, 131–144 (with D. Rader).
211. Prediction of Protein Secondary Structure Using Logical Analysis of Data. *Computational Methods in Science and Technology*, 7 (1), 2001, 7–25 (with J. Blazewicz and P. Lukasiak).
212. Combinatorial problems related to origin-destination matrices. *Discrete Applied Mathematics* 115, 2001, 15–36 (with E. Boros, F. Ricca and B. Simeone).
213. A satisfiability formulation of problems on level graphs. In Henry Kautz and Bart Selman (eds.), *Electronic Notes in Discrete Mathematics*, volume 9. Elsevier, 2001 (with B. Randerath, E. Speckenmeyer, E. Boros, A. Kogan, K. Makino, B. Simeone, and O. Cepek).
214. Pseudo-Boolean Optimization. In: *Handbook of Applied Optimization*, P. Pardalos and M. Resende (eds.), Oxford University Press, New York, 2002 (with Y. Crama).
215. Use of the Logical Analysis of Data Method for Assessing Long-Term Mortality Risk After Exercise Electrocardiography. *Circulation* 106, 2002, 685–690 (with M.S. Lauer, MD, FACC; S. Alexe, MS; E.H. Blackstone, MD, FACC; H. Ishwaran, Sc.D., and C. Pothier Snader, MA).
216. Pseudo-Boolean Optimization—A Survey. *Discrete Applied Mathematics* 123, 2002, 155–225 (with E. Boros).
217. Maximizing the product of two linear functions in 0–1 variables. *Optimization* 51 (3), 2002, 511–537 (with P. Hansen, P. Pardalos and D. Rader).
218. Cutting and surrogate constraint analysis for improved multidimensional knapsack solutions. *Annals of Operations Research* 117, 2002, 71–93 (with M.A. Osorio and F. Glover).
219. Disjunctive and conjunctive representations in finite lattices and convexity spaces. *Discrete Mathematics* 258, 2002, 13–25 (with S. Foldes).
220. The maximum box problem and its application to data analysis. *Computational Optimization and Applications* (with J. Eckstein, Y. Liu, M. Nediak and B. Simeone).
221. Coronary risk prediction by Logical Analysis of Data. *Annals of Operations Research* 119, 2003, 15–42 (with S. Alexe, E. Blackstone, H. Ishwaran, M. Lauer and C. Pothier Snader).
222. A heuristic for Boolean optimization problems. *Journal of Heuristics* 9, 2003, 229–247 (with T. Davoine and B. Vizvari).
223. Struction revisited. *Discrete Applied Mathematics* 132, 2004, 27–46 (with G. Alexe, V. Lozin and D. de Werra).

224. Ovarian cancer detection by logical analysis of proteomic data. *Proteomics* 4, 2004, No. 3, 766–783 (with G. Alexe, S. Alexe, L. Liotta, E. Petricoin, and M. Reiss).
225. Disjunctive analogues of submodular and supermodular functions. *Discrete Applied Mathematics* 142, 2004, 53–66 (with S. Foldes).
226. Pareto-optimal patterns in Logical Analysis of Data. *Discrete Applied Mathematics* 144, 2004, 79–102 (with A. Kogan, B. Simeone and S. Szedmak).
227. Saturated systems of homogeneous boxes and the Logical Analysis of Numerical Data. *Discrete Applied Mathematics* 144, 2004, 103–109 (with Y. Liu, B. Simeone and S. Szedmak).
228. Consensus algorithms for the generation of all maximal bicliques. *Discrete Applied Mathematics* 145, 2004, 11–21 (with G. Alexe, S. Alexe, Y. Crama, S. Foldes and B. Simeone).
229. Splitoids. *Graph Theory Notes of New York XLVI*, 2004, 36–40 (with I. Zverovich).
230. Construction of a maximum stable set with k-extensions. *Combinatorics, Probability and Computing* 14, 2005, 311–318 (with Igor Zverovich)
231. Submodularity, supermodularity and higher order monotonicities of pseudo-Boolean functions. *Mathematics of Operations Research* 30, No. 2, 2005, 453–461 (with S. Foldes).
232. Logical analysis of diffuse large B-cell lymphomas. *Artificial Intelligence in Medicine* 34, 2005, 235–267 (with G. Alexe, S. Alexe, D. Axelrod, and D. Weissmann).
233. Computational approach in proteomics. *IEEE Engineering in Biology and Medicine* 24 (3), 2005, 88–94 (with J. Blazewicz and P. Lukasiak).
234. Logical Analysis of Data. *Encyclopedia of Data Warehousing and Mining*, Idea Group Reference, Hershey, London, Melbourne, Singapore, 2005, 689–692 (with E. Boros and T. Ibaraki).
235. Bisplit Graphs. *Discrete Mathematics* 299, 2005, 11–32 (with A. Brandstadt, Van Bang Le, and V.V. Lozin).
236. A computational approach to predicting cell growth on polymeric biomaterials. *J. Biomed. Mater. Res.*, 73A (1), 2005, 116–124 (with Sascha Abramson, Gabriela Alexe, and Joachim Kohn).
237. A simple test for integer programming problems with bounded integer variables. *Annales Univ. Sco. Budapest* 48, 2005, 9–14 (with P. Kas and B. Vizvari).
238. Pattern-Based Clustering and Attribute Analysis. *Soft Computing* 10 (5), 2006, 442–452 (with Gabriela Alexe and Sorin Alexe).
239. Accelerated Algorithm for Pattern Detection in Logical Analysis of Data. *Discrete Applied Mathematics* 154 (7), 2006, 1050–1063 (with S. Alexe).
240. Spanned Patterns in the Logical Analysis of Data. *Discrete Applied Mathematics* 154 (7), 2006, 1039–1049 (with G. Alexe).
241. A Boolean measure of similarity. *Discrete Applied Mathematics* 154 (16), 2006, 2242–2246 (with Martin Anthony).
242. Modeling Country Risk Ratings Using Partial Orders. *European Journal of Operational Research* 175, 2006, 836–859 (with A. Kogan and M. Lejeune).
243. Combinatorial analysis of breast cancer data from gene expression microarrays. *Breast Cancer Research* 2006, 8:R41 (with G. Alexe, S. Alexe, D. Axelrod, T. Bonates, P.L. Hammer, I. Lozina, and M. Reiss).
244. Logical Analysis of Data: From Combinatorial Optimization to Medical Applications. *Annals of Operations Research* 148, 2006, 203–225 (with Tiberius Bonates).
245. Pattern-Based Feature Selection in Genomics and Proteomics. *Annals of Operations Research* 148, 2006, 189–201 (with Gabriela Alexe, Sorin Alexe, and Bela Vizvari).

246. Local search heuristics for Quadratic Unconstrained Binary Optimization (QUBO). *J. Heuristics* 13, 2007, 99–132 (with E. Boros and G. Tavares).
247. Weighted stability number of graphs and weighted satisfiability: the two facets of pseudo-Boolean optimization. *Annals of Operations Research* 149, 2007, 67–74 (with D. de Werra).
248. Approximation of the quadratic set covering problem. *Discrete Optimization* 4 (3–4) 2007, 378–386 (with B. Escoffier).
249. Pattern-Based Discriminants in the Logical Analysis of Data. *Data Mining in Biomedicine*, P. Pardalos, V. Boginski and A. Vazacopoulos (eds.) (2007), Biocomputing, Springer (with S. Alexe).
250. Logical Analysis of Computed Tomography Data to Differentiate Entities of Idiopathic Interstitial Pneumonias. *Data Mining in Biomedicine*, P. Pardalos, V. Boginski and A. Vazacopoulos (eds.) (2007), pages 193–208, Biocomputing, Springer (with Michel William Brauner, Nadia Brauner, Irina Lozina, Dominique Valeyre).
251. A max-flow approach to improved lower bounds for quadratic 0-1 minimization. *Discrete Optimization* 5 (2), 2008, 501–529 (with E. Boros and G. Tavares).
252. Comprehensive vs. comprehensible classifiers in Logical Analysis of Data. *Discrete Applied Mathematics* 156 (6) (2008), 870–882 (with G. Alexe, S. Alexe and A. Kogan).
253. Artificial attributes in analyzing biomedical databases. *Data mining and mathematical programming* 41–65, CRM Proc. Lecture Notes 45, American Math. Soc., Providence, RI, 2008 (with Z. Csizmadia and B. Vizvari).
254. Maximum patterns in datasets. *Discrete Applied Mathematics* 156 (6), 2008, 846–861 (with T. Bonates and A. Kogan).
255. Logical Analysis of Data (LAD) model for the early diagnosis of acute ischemic stroke. *BMC Medical Informatics and Decision Making*, 2008 (with A. Reddy, H. Wang, H. Yu, T.O. Bonates, V. Gulabani, J. Azok, G. Hoehn, A. Baird and K.C. Li).
256. Improved screening for growth hormone deficiency using logical analysis data. *Medical Science Monitor* 15, 1 MT5-10, 2009 (with Pierre Lemaire, Nadia Brauner, Christine Trivin, Jean-Claude Souberbielle, Raja Brauner).
257. Using a similarity measure for credible classification. *Discrete Applied Mathematics* 157 (5), 2009, 1104–1112 (with M. Subasi, E. Subasi and M. Anthony).
258. Algebraic and topological closure conditions for cases of pseudo-Boolean functions. *Discrete Applied Mathematics* 157 (13), 2009, 2818–2827 (with S. Foldes).
259. Reverse-engineering country risk ratings: a combinatorial non-recursive model. *Annals of Operations Research* (with A. Kogan and M.A. Lejeune) (doi: 10.1007/s 10479-009-0529-0) April 2009
260. A new imputation method for incomplete binary data. *Discrete Applied Mathematics* 2011 (with Mine Subasi, Ersoy Subasi, Martin Anthony) (doi: 10.1016/j.dam.2011.01.024)
261. Logical Analysis of Data: Classification with Justification. *Annals of Operations Research*, 2011 (with Endre Boros, Yves Crama, Toshihide Ibaraki, Alexander Kogan, and Kazuhisa Makino).

3.5 RUTCOR research reports

262. A characterization of chordal bipartite graphs. *RRR* 16-89 (with F. Maffray and M. Preissmann).

- 263. The DDT Method for quadratic 0-1 minimization. RRR 39-89 (with E. Boros and X. Sun).
- 264. Clique separation and universal threshold graphs. RRR 28-91 (with A. Kelmans).
- 265. On a transformation which preserves the stability number. RRR 69-91 (with A. Hertz).
- 266. A generalization of the pure literal rule for satisfiability problems. RRR 20-92 (with E. Boros).
- 267. Forbidden subsystem characterization of matroids and applications to classes of matroid generating graphs. RRR 38-2001 (with I. Zverovich).
- 268. Preprocessing of unconstrained quadratic binary optimization. RRR 10-2006 (with E. Boros and G. Tavares).
- 269. Boolean Separators and Approximate Boolean Classifiers. RRR 14-2006 (with I. Lozina).
- 270. Pseudo-Boolean Regression. RRR 3-2007 (with Tibérius O. Bonates).
- 271. Reverse-engineering banks' financial strength ratings using logical analysis of data. RRR 10-2007 (with A. Kogan and M.A. Lejeune).
- 272. Composite Boolean separators for data analysis. RRR 14-2007 (with Irina I. Lozina).
- 273. A Branch-and-Bound Algorithm for a Family of Pseudo-Boolean Optimization Problems. RRR 21-2007 (with Tibérius O. Bonates).
- 274. Large Margin LAD Classifiers. RRR 22-2007 (with Tibérius O. Bonates).
