In the original publication under subheading “Data analysis” of the section Materials and methods, the fourth paragraph “According to Burnham and Anderson (1998), when the ratio is $\frac{n}{K} < 40$, the AIC needs adjustment. Thus, the AIC_c was calculated as:

$$AIC_c = AIC + \frac{2k(k+1)}{n-K-1}$$

where n indicates the number of observations and K is the number of parameters in the model” is incorrect.

The correct version is given below.

According to Burnham and Anderson (1998), when the ratio is $\frac{n}{K} < 40$, the AIC needs adjustment. Thus, the AIC_c was calculated as:

$$AIC_c = AIC + \frac{2K(K+1)}{n-K-1}$$

where n indicates the number of observations and K is the number of parameters in the model.

In the sixth paragraph first line “Because the likelihood of the model decreases with the increase of Δ_i , the model with $4 \leq \Delta_i \leq 7$ has weak empirical support and should be less considered, and the model with a $\Delta_i \geq 10$ can be omitted because it has no strong empirical support (Burnham and Anderson 1998)” is incorrect.

The correct version is given below.

Because the likelihood of the model decreases with the increase of Δ_i , the model with $4 \leq \Delta_i \leq 7$ has weak empirical support and should be less considered, and the model with a $\Delta_i \geq 10$ can be omitted because it has no strong empirical support (Burnham and Anderson 1998).
