There is an error in Table 1 of the recently published ISCEV Standard for full-field clinical electroretinography (2015 update) [1]. Users of this standard should note that the filter settings for dark-adapted oscillatory

potentials (OPs), as correctly specified in the text, require that the high-pass filter should remove frequencies of 75 Hz and below from the ERG waveform; the low-pass filter setting of 300 Hz or above is the same as for other ERG tests. Table 1 is provided below with the correct bandpass for OPs

The online version of the original article can be found under doi:[10.1007/s10633-014-9473-7](https://doi.org/10.1007/s10633-014-9473-7).

Table 1 Stimulus and recording parameters for ISCEV standard full-field ERGs

ERG test	Adaptation/background strength and time	Stimulus strength (range)		Inter-stimulus time (rate)	Recording bandpass (Hz)	Main physiological generator(s)
		Photopic cd s m^{-2}	Scotopic cd s m^{-2}			
Dark-adapted 0.01 ERG	DA ≥ 20 min	0.01 (0.008–0.013)	0.025 (0.02–0.03)	≥ 2.0 s (≤ 0.5 Hz)	≤ 0.3 ≥ 300	<i>b-wave</i> : rod-initiated on pathways
Dark-adapted ^a 3.0 ERG	DA ≥ 20 min	3.0 (2.7–3.4)	7.5 (6.7–8.4)	≥ 10 s (≤ 0.1 Hz)	≤ 0.3 ≥ 300	<i>a-wave</i> : photoreceptors and post-receptor on pathways <i>b-wave</i> : on and off bipolar cells
Dark-adapted ^a 10 ERG	DA ≥ 20 min	10 (8.9–11.2)	25 (6.7–8.4)	≥ 20 s (≤ 0.05 Hz)	≤ 0.3 ≥ 300	<i>a-wave</i> : photoreceptors and post-receptor on pathways <i>b-wave</i> : predominantly rod bipolar cells (on pathways)
Dark-adapted ^a OPs	DA ≥ 20 min	3.0 (2.7–3.4)	7.5 (6.7–8.4)	≥ 10 s (≤ 0.1 Hz)	75 ^b ≥ 300	On and off pathways reflecting middle retinal layers and vascular function
Light-adapted 3.0 ERG	30 $\text{cd m}^{-2} \geq 10$ min	3.0 (2.7–3.4)	7.5 (6.7–8.4)	≥ 0.5 s (≤ 2.0 Hz)	≤ 0.3 ≥ 300	<i>a-wave</i> : cones with post-receptor on and off pathways <i>b-wave</i> : on and off bipolar cells
Light-adapted 30 Hz flicker	30 $\text{cd m}^{-2} \geq 10$ min	3.0 (2.7–3.4)	7.5 (6.7–8.4)	0.036–0.030 s (28–33 Hz)	≤ 0.3 ≥ 300	Cone systems with post-receptor on and off pathways

^a 'Dark-adapted' ERGs are recorded ERGs without further dark adaptation. Thus only the weak flash ERG is a fully dark-adapted response

^b Filters should remove frequencies below 75 Hz. Filtering somewhat higher frequencies is acceptable but Standard OPs must include frequencies between 100 and 300 Hz
