Springer publishers would like to apologize for the omission of the last article page of “Stress Concentration Around a Strongly Oblate Spheroidal Cavity in a Transversely Isotropic Medium” by Professor Chun-Ron Chiang, printed and online in *The International Journal of Fracture*, Volume 119, Issue 4, 2003, pp. L91–L97. Please find below the missing article page content that should be regarded by the reader as part of the final version.

for this type of cavity, in contrast with the isotropic case, K_t depends on the elastic modulus. A relation between the stress intensity factor K of a penny shaped crack and the crack tip stress is established via the stress rounding factor Ω , Eq. (19). The stress rounding factor is explicitly determined. Numerical values for some hexagonal single crystals are calculated and given in Table 1.
