“Effect of Target Position and Target Task on Judge Sensitivity to Felt Rapport” by Nancy M. Puccinelli, Linda Tickle-Degnen, and Robert Rosenthal

Page 216, Table 1. The effect size for the variable Responsiveness, Experiment 1 was misreported. The correct effect size is .37

Page 217, Table 2. The table label and column headings were incorrect. The table should have appeared as follows:

TABLE 2

Main Effect of Target Task

Composite Variable		Puzzle Interaction (<i>M</i>)	Discussion Interaction (<i>M</i>)	<i>p</i>	<i>r</i> (Effect size)
Critical Scrutiny	E1	−.039	.086	<.05	.36
	E2	−.009	.034	.435	.15
Dominance	E1	.048	.058	.873	.03
	E2	−.032	−.110	.173	−.26
Friendliness	E1	.121	−.063	<.001	.56
	E2	.078	−.158	<.001	.70
High Status	E1	−.051	−.025	.609	.09
	E2	−.058	−.068	.848	−.03
Polite Sympathy	E1	.097	.066	.555	.11
	E2	.079	−.132	<.001	.57
Responsiveness	E1	−.023	−.077	.280	.20
	E2	.082	−.088	<.01	.53

Note. Means represent the average Fisher Zr coefficient across judges for each composite variable. A positive effect size *r* represents an effect in the predicted direction. E1 refers to results from Experiment 1 (*df* = 30) and E2 refers to results from Experiment 2 (*df* = 27).
