In the above mentioned article, the last two paragraphs should be revised. They should read as follows:

A limitation of the present study is that the respondents were only 124 subjects equally divided among Holocaust survivor's grandchildren and grandchildren of a presumably nonJewish comparison group. Thus differences between the two groups may be a function both of having families that (1) underwent or did not undergo the horrendous Shoah experience, and (2) whether they were influenced or not influenced by the ancient and rich Jewish tradition, one which had a long experience of dealing constructively with traumatic events.

Controlling for Jewishness would necessitate a comparison of grandchildren of Jewish survivors from a country occupied by the Nazis with a Jewish control group from a country not occupied by the Nazis (for example, the United States). Ideally, this part of the study would involve comparing Jewish groups in a country such as Italy, with a Jewish control group in The United States, and a Jewish group in Israel would yet be another important control. In addition non-Jewish control groups could be employed in these same three countries. Finally, future investigations would benefit from using larger samples, at least 100 subjects for each group, including Jewish and non-Jewish participants from these three countries.
