The original version of this article unfortunately contained a mistake. The data symbol labels in Fig. 3b are in error and should be reversed to read as follows: habituated (filled circles), cannula (open circles). The data from rats habituated to needle injections and receiving nicotine via needle injection are represented by the filled circles. The data from rats receiving nicotine via a chronically indwelling cannula are represented by the open circles. Likewise the text discussing Fig. 3b should have nicotine that is injected represented by filled circles, and nicotine administered by cannula represented by open circles. The full Fig. 3 in its correct form is as follows.

Figure 3 Nicotine administration increased the action potential firing rate of putative DA neurons from freely moving rats (time: $F(22,748)=9.50$, $p<0.05$) as measured by chronically implanted tetrodes. **a** The approximate recording sites within the VTA and SNc for each experimental group (open circle rats with cannula, filled circle rats habituated to the needle). Numerals denote the position (in millimeters) relative to bregma. **b** The normalized average firing rate of DA neurons in response to injection of nicotine, quinpirole, and eticlopride is shown from rats habituated to the needle injections ($n=19$ units) and from rats implanted with a chronic i.p. cannula ($n=17$ units). The illustration was adapted from Paxinos and Watson (1998)
