Erratum

Ph. Declercq et al.: Complicated Community-Acquired Soft Tissue Infection by MRSA from Porcine Origin Infection 2007 (published online: October 31, 2007) DOI 10.1007/s15010-007-7029-4

In the last paragraph of the “Case Report” section one sentence was incomplete. The correct text reads as follows:

Swabs from the patient's nares also grew a methicillin resistant *S. aureus* (MRSA), with a susceptibility pattern identical to the one of the wound isolate. Both isolates were nontypable by pulsed field gel electrophoresis analysis after digestion with the

classic *Sma I* endonuclease but resulted in a typical banding pattern encountered **with strains of pig origin** when digested with the *Xma I* enzyme. Furthermore, the isolates were negative for the Panton-Valentine leucocidin genes.
