Erratum

Erratum to: T. Saito et al. Disseminated Aspergillosis Following Resolution of *Pneumocystis* Pneumonia with Sustained Elevation of Beta-Glucan in an Intensive Care Unit: a Case Report. *Infection* 2009; 37: 547–550 (DOI 10.1007/s15010-009-8108-5)

There were errors in the captions to Figures 1 and 2. Please note the corrected captions.

Figure 1. Kinetics of the (1 → 3)- β -D-glucan (BG; filled circles) and galactomannan (GM; diamonds) assays in this case. The GM levels were persistently negative (<0.2 ng/ml), whereas the BG concentration showed a sustained elevation (>100 pg/ml) and had a resurgence on the 31st ICU day.

Fig. 2. Macroscopic picture (a) and microphotographs (b to d) of lung tissue from the patient described here: a) an abscess formation on the surface of left upper lobe; b) hematoxylin-eosin staining, and c) Grocott stain show proliferating fungi with angioinvasion; d) DNA in situ hybridization with the *A. fumigatus* alp-568 probe demonstrates specific signals within the same area.
