Sir,

We agree with Gozdas et al. that peri-renal abscess is a rare condition. As stated in the methods and results sections, we grouped together renal and peri-renal abscesses (“renal or peri-renal abscess”). In two patients, computed tomography (CT) scan showed renal abscesses. CT scan also showed a marked infiltration of the peri-renal adipose tissue without collection for the other patient. Hence, none of

our patients had peri-renal abscess, while two had renal abscesses. To conform to the text of our paper, “Peri-renal abscess” in Table 1 should read “Renal or peri-renal abscess”. These modifications do not alter the conclusions of our work.

Conflict of interest None.
