

Arch Dermatol Res (1994) 286:507

Comparative study of indirect immunofluorescence and immunoblotting for the diagnosis of autoimmune pemphigus

E. Cozzani, J. Kaniakis, J.-F. Nicolas, D. Schmitt, J. Thivolet

Laboratory of Dermatopathology/Department of Dermatology (Pr. A. Claudy) and INSERUM U346 (D. Schmitt), Hôpital Edouard Herriot, F-69437 Lyon cedex 03, France

Arch Dermatol Res (1994) 286:295–299

On page 296, on the first line of the right-hand column,
the sentence should read as follows:

“... against the surface of keratinocytes of MO ($n = 46$,
i.e. 85%) and/or of RL ($n = 41$, i.e. 76%).”
