Translated from Metallurg, No. 11,
p. 38, November, 1964

There was an inaccuracy in the article by V. V. Lempitskii, "Metallurgy of chemistry," in issue No. 7, 1964: it was indicated that it was completely possible to use, without large expenditures, spent pickling solutions for the production of ammonium sulfate. At present the possibility of using sulfuric acid spent after pickling metal is only still being investigated by the Central Institute of Ferrous Metallurgy, and the economic expediency of this has still not been established.

In the article by N. T. Masyukov, in issue No. 9, 1964, on page 19 line 14 on the right-hand side it should read: "Firing of the tuyeres was carried out..."
