

Jan Tichý: Электрическая эквивалентная схема затухающих колебаний изгиба...

проверка до сих пор выведенных формул. Одновременно будет полезно исследовать теоретически влияние внешнего трения на величины электрической эквивалентной схемы.

Толчок к работам, посвященным электрической эквивалентной схеме колебаний пьезоэлектрических шлифов, дал проф. В. Петржилка. Я ему очень благодарен за постоянное внимание и за многие ценные советы. Выражаю искреннюю благодарность за некоторые замечания П. Халоупке и ассистенту Ф. Сопке.

THE ELECTRICAL-EQUIVALENT CIRCUIT OF DAMPED FLEXURAL VIBRATIONS OF PIEZOELECTRIC BARS

(Abstract of preceding paper)

JAN TICHÝ

Chair of Mathematics and Physics, Faculty of Engineering, Liberec

The paper first gives the equation of motion for damped flexural vibrations of an infinitely thin bar (8) derived with regard to the damping caused by internal friction. If we consider the arrangement of electrodes shown in Fig. 3 for the piezoelectric excitation of flexural vibrations we can write the exciting moment of the piezoelectric strain in the form (11). $\xi(x)$ denotes the function of x which, with the given arrangement of electrodes, takes on the values (12). The equation of motion for forced flexural vibrations of a piezoelectric bar (13) is solved by means of the series expansion (16). The vibrations in the stationary state have the same frequency as the exciting force but are displaced in phase. The mechanical deformations (30) are calculated and from them, by the usual method, the desired values of the electrical equivalent circuit (40)–(43) are obtained. The effect of gaps between the electrodes and the piezoelectric bar is also considered.
