Kinetics of Nitrate and Ammonium Uptake by the Natural Populations of Marine Phytoplankton in the Surface Water of the Oyashio Region during Spring and Summer

AKIHIRO SHIOMOTO, KATSUYUKI SASAKI, TORU SHIMODA and SATSUKI MATSUMURA

Journal of Oceanography, Vol. 50, pp. 515–529

Figure Legends

Figures 1, 2 and 3 should be read as follows;

Fig. 1. Location of sampling stations in the Oyashio region. Spring stations are denoted as Stas. 1, 2, 3 and 4, while those of the summer as Stas. 5, 6 and 7.

Fig. 2. Vertical profiles of σ_t (●) and concentrations of nitrate (○) and ammonium (△) shallower than 100 m. Arrows indicate the depth of the euphotic zone (the 1% light level).

Fig. 3. Uptake rates as functions of nitrate and ammonium concentrations in the spring (a) and summer (b). Arrows indicate the ambient nutrient level before tracers were added.
