Correction to the paper:**' $\aleph_0$ -categoricity of two-sorted structures'**

P. Olin

The last sentence of [1] is: 'R. Burns has remarked that $\aleph_0$ -categoricity is preserved by factor groups – i.e. if G is $\aleph_0$ -categorical and $H \triangleleft G$ then G/H is $\aleph_0$ -categorical.' The proof of the remark is mistaken. It follows from Theorems 1 and 2 of Rosenstein [2] that the statement is true if G is Abelian. As U. Felgner (who we thank for bringing the matter to our attention) has pointed out, it is true if we add to the statement the hypothesis that H be a characteristic subgroup of G . However the result is false in general. A counterexample due to J. G. Rosenstein appears elsewhere in this issue, and therein Rosenstein cites another counterexample due to G. Sabbagh.

If the last sentence of [1] is deleted nothing else in the paper is affected.

We take this opportunity to make a further but minor correction in [1]. On page 268, the tenth line from the bottom should read: '... Hence by the above, *infinitely many* members of...'.
