BOOK REVIEW

COSMIC PURPOSE AND HUMAN CONSCIOUSNESS

By Richard A. Mould, Wipf and Stock Publishers, 2015, 114 pages

How many times has consciousness been, or will it be, introduced in different parts of the Universe? These unique events may happen again and again, and the creative ability of consciousness is the story that never may end. 'Consciousness is not possessed by our brains, it is only reflected by our brain,' and 'The question then is: where does reflected consciousness come from?' are main topics of this approach to Cosmic Purpose and Human Consciousness.

The author explains how science research enables to create vast and wonderful conceptualizations of objective universe by building on the "quantitative" features of human experience. On the other hand these ways of understanding of nature and the universe likely cannot support an idea of cosmic purpose because it is per se without consciousness in its basic postulates.
