Genetic mapping of Afr2 (Rif): regulator of gene expression in liver regeneration, by D.K. Jin and M.H. Feuerman

Further study has shown that the reported haplotype of the single mouse showing a recombinant event between D2Mit208 and D2Mit304 (and Afr2) was incorrect. That recombination event occurred between markers D2Mit280 and D2Mit258, resulting in 4 SSLP markers (D2Mit258, D2Mit224, D2Mit208 and D2Mit304) co-segregating with Afr2 in our population of 332 mice.
