Correction to: Diabetologia

<https://doi.org/10.1007/s00125-014-3413-7>

A splice in the blots shown in Fig 1a was not indicated when the article was published originally. Publication predated *Diabetologia's* current policy that 'Groupings and consolidation of data (e.g. removal of lanes from gels and blots)

must be made apparent by the arrangement of figures (e.g. dividing lines) and should be explicitly indicated in the text of the figure legend'. The authors apologise for the failure to delineate this correctly but confirm that the splice does not affect the results or the conclusions of the paper. The original figure and figure legend have been updated.

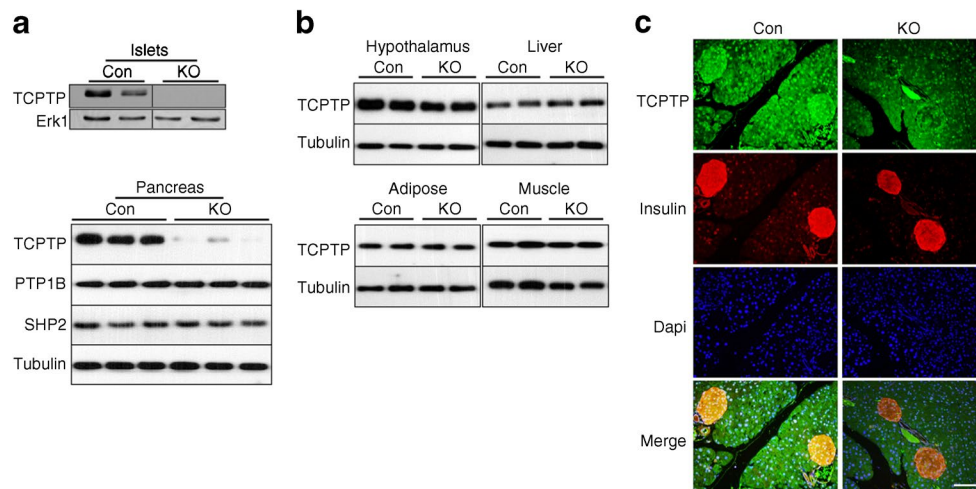

Fig. 1 Pancreatic *Ptpn2* (TCPTP) deletion. (a) Islets lysates from TCPTP^{fl/fl} (Con) and panc-TCPTP KO mice immunoblotted for TCPTP and Erk1. Representative immunoblots are shown, $n=3$; lines indicate removal of lanes from the immunoblots. Whole pancreas lysates from Con and KO mice immunoblotted for TCPTP, PTP1B, SHP2

and tubulin. (b) Representative immunoblots of TCPTP and tubulin in lysates of hypothalamus, liver, adipose and muscle of Con and KO mice, $n=4$. (c) Pancreases of Con and KO female mice fed HFD for 36 weeks were sectioned and immunostained for TCPTP (green), insulin (red) and DAPI (blue). Scale bar 100 μm

The original article can be found online at <https://doi.org/10.1007/s00125-014-3413-7>.
