Prompt

A 45-year-old man with metastatic non-small cell lung cancer undergoes standard restaging CT (Fig. 1a–c). One month later,

he presents with shortness of breath, and CT pulmonary angiogram (CTPA) is performed (Fig. 2a, b).

Fig. 1 a–c Arterial phase contrast enhanced CT at restaging presentation

Fig. 2 a, b Pulmonary arterial phase CT 1 month later

The diagnoses can be found at <https://doi.org/10.1007/s00256-019-03358-y>
