<https://doi.org/10.1007/s00330-020-06663-6>

The original version of this article, published on 21 February 2020, unfortunately contained a mistake. The optimal *Intensity-Skewness* cutoff of the imaging biomarker is < -1.5 . Therefore, in the abstract, the last sentence of section “Results” should read: “A criterion of *Intensity-Skewness* < -1.5 , which indicated high tumor density, showed high specificity of 96% (sensitivity 46%) and 99% (sensitivity 53%) on predicting the mid/poor DFS group in the training and external validation cohorts, respectively.”

The second key point should read: “An *Intensity-Skewness* of < -1.5 has high specificity in predicting the mid/poor

disease-free survival histologic patient group in both the training cohort and the external validation cohort.”

And in “Results,” the last sentence of paragraph “Cutoff analysis” should read: “As shown in Fig. 4, the cutoff *Intensity-Skewness* < -1.5 could achieve high specificity to predict the mid/poor DFS group, especially in the training and external validation cohorts which had specificity of 96% (sensitivity 53%) and 99% (sensitivity 46%), respectively.”

Publisher’s note Springer Nature remains neutral with regard to jurisdictional claims in published maps and institutional affiliations.
