*“Ocular Surface Disease—Medical and Surgical Management”*, edited by Edward J. Holland and Mark J. Mannis, is a comprehensive new textbook that covers a wide range of ocular surface diseases. Internationally renowned experts give a thorough overview of the emerging field of ocular surface disease with special emphasis on blepharitis, dry eye, epithelial adhesion disorders, pterygium, and stem cell deficiency disorders in particular. The pathogenesis of these disorders is detailed on the

basis of the most recent information on the underlying cellular and molecular alterations of ocular surface and tear film. Instructive schematic drawings and photographs are employed to explain new and promising therapeutic strategies and surgical procedures that provide improved visual outcome even for patients who would have ended up with devastating and blinding eye disease only a few years ago. This is one of the best books in the field!
